Miscellaneous Notes.—In McCutcheon's letter to the Chicago Record from the fleet at Manila, dated May 21st, is this passage: "I have had a talk to-day with an American named Silver, lately employed by the Manila Electric company, who escaped to our ships a few days ago, and is now on the American transport Zafiro. He says that, with the assistance of men from his company, the Spaniards had completed before the battle twenty-five electric torpedoes, to be used in guarding the entrance to the bay. The work of placing them, however, had not been finished, and the promptness of Admiral Dewey in entering the bay defeated the plans to keep him out."

It is said that the telegraph office at the Island of Grand Canary, near the center of the Canary Islands, the chief city of which is Las Palmas, has been seized by the Spanish authorities. All telegrams except the barest commercial messages have been stopped.

Twelve searchlights, to be mounted on fortifications along the Atlantic coast, were shipped from New York a few days ago under direction of the depot quartermaster. The names of the fortifications where they are to be mounted are withheld.

It is stated that during the recent state of Señor Polo de Bernabe, the late Spanish minister to the United States, in Montreal, the cable bills of the party for messages sent by both the Great Northwestern and Canadian Pacific Telegraph companies amounted to $300 a day. It is said that the Spaniards communicated with their agents in the United States, by means of the cable to London, whence their messages were cabled back to America, and vice versa. To be sure of secrecy they sent half of each of their cipher message by one and the other half of the message by the other company. The former company is connected with the Western Union and the latter with the Postal Telegraph company in the United States.

Two British steamships which arrived at New York May 20th brought the shore end of the story of the bombardment of San Juan, Porto Rico, by Admiral Sampson's squadron on Thursday, May 12th. One of these, the New York and Porto Rico liner Arkadia, left San Juan on May 14th, two days after the bombardment, and among its passengers was William Cantrell, an Englishman, who, it is said, represented an American electric-light company at Ponce.

The China Mail, which is printed in Hongkong, was eagerly scanned upon its arrival with the last batch of mail from the far East. The latest number received was printed before the news of Dewey's victory had been received. There is a good deal of interesting information about the preparations of the American fleet for the encounter with the Spaniards, and there seemed to be no doubt as to the outcome of the conflict. Philippine news of April 12th shows that large bands of insurgents twice succeeded in gaining entrance to Manila under the mistaken idea that the American warships had arrived. Shops were closed and doors barred, but the natives left when they discovered their mistake. The Spanish authorities were attempting to strengthen their fortifications, but they had only mounted a half dozen six-inch guns. They had also laid mines in the harbor. Several miles of cable were bought of a cable ship for mining purposes. Advices were received from the Island of Cebu announcing the massacre of the governor and Spanish officials. The natives rose suddenly and gained control of the whole island. They cut the cable and news was taken to Iloilo, on the neighboring island of Panay, by a sailing vessel.

Mention has already been made of the appreciation displayed by Admiral Dewey for the electrical equipment of modern war vessels, and in this connection it may be interesting to reproduce from the Western Electrician of November 22, 1890, the following paragraph from an article entitled "Electricity on Warships:"

Commodore George Dewey, chief of the Bureau of Equipments of the United States Navy, in his annual report to Secretary Tracy, makes the following comment on the introduction of electricity in the naval service: "The lighting of ships of war by electricity, which was inaugurated by this government, has now become so essential that no warship is considered complete which is not so lighted. Special attention has been given during the year to the subject of means of interior communication on shipboard, and a telephone system is soon to be added experimentally to other devices in use on board one of the new cruisers. Night signaling by electricity has also been and is still actively under consideration. A most notable feature in connection with the extensive telegraphic time service, which has become an established and apparently an indispensable commercial factor centering at the Naval Observatory, has been a concerted attack upon the prevalent system by a large number of observatories located throughout the United States, the object being to break up the system in order that time, which is now furnished without cost from the Naval Observatory, may be distributed and charged for at these minor observatories as a means of contributing to their maintenance."

Electric, Cable and Horse Cars.

[From the New York Sun.]

The revenues from horse-cars have been for a number of years very much on the decline in New York state, and they now compare most unfavorably with the receipts from electric and cable companies. Oddly enough New York city is almost the only large city of the state which still adheres at all to the old-fashioned surface cars. In 1896, according to the report of the railroad commissioners, the total receipts of horse-car lines in the various cities of the state amounted collectively to $4,467,200, against $24,400,000 from street railroads operated by traction. The total earnings of the elevated railroads in that year were, approximately, $12,000,000. Last year, it appears from the report of the railroad commissioners, the earnings of the elevated railroads were substantially the same as they had been the year before, while the trolley and cable roads increased about 10 per cent. over the year before, but the horse-car receipts still further decreased, amounting in all, according to the report, to $3,180,000, an insignificant figure when compared with the totals of the other companies.

The popularity of trolley and cable lines is to be ascribed to the increased volume of business which they can handle, the better speed which they attain and the natural obstacles which they overcome. This last does not apply to any great extent to the city of New York, but in most of the large cities of New York state, built usually on the line of the rivers, there are hills, and access to these hills has always been difficult by the former method of horse-car lines, whereas no such difficulties impede or embarrass the trolley lines now general throughout the state, and to be found, in fact, in nearly every city.

Another consideration which has probably had much to do with the change in motive power is the reduction in expense following the abandonment of horse cars. As shown by the railroad commissioners' report, the operating expenses of the elevated railroads of the state amounted to about 65 per cent. of the receipts, leaving a large margin of profit. The operating expenses of the trolley and cable lines were about 55 per cent. of the receipts, leaving

45 per cent. of the earnings as profit from operation. The expenditures of the horse cars are nearly 80 per cent. of the receipts, forage being an item of importance, the renewal of horses another, and stable expenses a third. One of the New York street-car lines, for instance, which took in last year $570,000 from fares, expended $52,000 for fodder, $8,500 for horse-shoeing, $12,000 for the renewal of horses, $34,000 for stable expenses, and $3,000 for harness, a total of $110,000 for these items alone.

Development of a School of Electrical Engineering.[1]

By Harold B. Smith, M. E.

Within the last 15 years there has arisen the new profession of the electrical engineer, and it has become necessary to provide professional schools where a proper preparation for his work may be found.

The frequently-quoted remark of Lord Kelvin, that the electrical engineer should be nine-tenths mechanical and one-tenth electrical, was made before the advent of the electrical engineer as we know him to-day, and no longer holds true. While it has been held by some that this ratio should be reversed, that, also, is undoubtedly an extreme statement of the case. The relative training in the two lines of engineering work which is desirable for the electrical engineer necessarily depends upon the class of work to which he proposes to devote himself, but in any event, should be much more nearly equal than indicated by either of the above statements.

Perhaps an approximation to the following relations in his training is as likely to bring success to the young electrical engineer as any that can be suggested: Electrical-engineering training, 10 per cent.; mechanical-engineering training, five per cent.; the possession or cultivation of an interest in his work, five per cent.; the habit of independent logical thought, five per cent., and the remaining 75 per cent. should be sterling manhood.

It remains, then, for the school of electrical engineering to provide about 10 per cent. of his training in the best manner possible.

There are, at present, four general lines of work in which the graduate in electrical engineering may find a place for himself, though many positions involve decided ability in more than one of these lines:

1. The engineer having to do with the design and manufacture of electrical apparatus.

2. The engineer installing and operating electrical apparatus and systems.

3. The engineer connected with electro-chemical or electro-metallurgical operations.

4. The consulting and experimental engineer and the teacher.

These lines of work have much in common which may be taken up profitably in a regular four-years' undergraduate course of study, which, in most institutions, leads to the degree of bachelor of science, leaving the special and more advanced work to graduate study and experience, before granting the degree of electrical engineer.

From a careful study of the courses of instruction offered to electrical-engineering students in the various educational institutions, and personal experience in the development of the electrical courses of four such institutions, appears to the writer that four distinct lines of undergraduate study should be provided in a school of electrical engineering:

1. Lectures dealing with the theory, practical operation, and description of electrical apparatus, machinery and systems should constitute about 47 per cent. of the work.

2. About 20 per cent of the time should be given to laboratory work, involving the practical operation, testing and theory of electrical apparatus and systems. The basis of this course should be to provide the students with as wide an experience and knowledge as possible, even at a certain sacrifice of training in original and independent methods.

3. A course in electrical design, so planned as to thoroughly impress upon the student the theory and principles on which electrical apparatus and systems are based, should require about 20 per cent. of the time. While primarily for this purpose, it may serve as a basis for further study leading to competence as a designing engineer.

4. About 20 per cent. of the time should be devoted to the preparation of a thesis involving original and independent work on the part of the student, and supplying, so far as possible, the lack of training in this respect in the laboratory courses.

The courses should be based on a thorough training in mathematics, physics, chemistry, drawing, shopwork, mechanical engineering and modern languages, and lead to the more advanced graduate courses in which the student may devote a larger proportion of his time to purely professional and special work, though under an arrangement of time as thoroughly systematized as the undergraduate courses.

The present courses in electrical engineering at the Polytechnic Institute have been developed on the basis outlined, and since the reorganization of the department in 1896 the laboratories and other facilities of the department have been shaped to meet the demands of the courses as rapidly as possible.

[1] From the Journal of the Worcester Polytechnic Institute.

The laboratories in operation and process of development are as follows:

1. A power laboratory containing boilers (200 horse power), engines (225 horse power), generators (standard systems and voltages, 225 horse power) and marble switchboard arranged closely in accordance with usual station practice, but with special provisions to make all available for purposes of experimentation and instruction.

2. A laboratory for general direct-current experimental work provided with a good assortment of direct-current machines, apparatus and instruments, all of which are connected to a slate switchboard having over 300 terminals.

3. A laboratory for general alternate-current experimental work in process of equipment, but already possessing a good collection of alternate-current apparatus and instruments connected to a slate switchboard of over 150 terminals.

4. A laboratory for calibration, standardization and special investigation in process of equipment and already containing a number of standards and special pieces of apparatus of considerable value, connected to a slate switchboard having about 200 terminals.

5. An electro-chemical and electro-metallurgical laboratory in process of equipment, but provided with a large storage battery, electric forge, electric furnaces, etc.

6. A photometric laboratory equipped with Reichsanstalt standards.

All of the laboratories are interconnected by an extremely flexible system of switchboards, so that the apparatus of any one laboratory is immediately available in connection with the work of any others, and special experimental work may be undertaken with a facility almost equal to that of the routine laboratory experiments.

Restriction Upon Right to Put Wires Underground.

The case of the State of Missouri against Murphy was originated by the Laclede Gaslight company in the Circuit Court for mandamus in the name of the state, to compel the street commissioner of the city of St. Louis to grant the company a permit to make the necessary excavation in a street, and put in a conduit system underground.

Although the company named originally furnished light by means of gas through underground pipes, when electricity came into use it furnished electric light through overhead wires, and then sought to put its wires under the surface, insisting that its charter gave it a vested right to do this, without being controlled by the municipal authorities.

From a decision against the company, in the Supreme Court of Missouri, in which the case up to the Supreme Court of the United States, and on April 11, 1898, the latter affirmed the judgment of the former. Chief Justice Fuller prepared the opinion of the court.

First of all, it is laid down as a basic principle that mandamus lies to compel a party to do that which it is his duty to do, but can confer no new authority, and that the party to be coerced must have the power to perform the act mentioned.

Assuming that the charter of the company to be in force, as contended, with the only limitation on its power to occupy the streets as it desired, being that the work should be done "with as much dispatch, and with as little inconvenience to the public as possible," it is held that the street commissioner could not be compelled by mandamus to issue the permit wanted, because he had no power, under the charter and ordinances of the city, to issue such permits in the absence of the assent of the Board of Public Improvements, which had general control, and with which the company filed no application giving details of the streets it wished to occupy, and the conditions on which the rights were to be secured, supported and insulated, and a plat of the route, as required by a city ordinance.

Judgment to this effect, it is said, in itself involved no federal question, for confessedly there was no question of right to leave private matters to be given by a particular officer. But the Supreme Court of the United States goes farther, and says that it concurs with the conclusion of the Supreme Court of the state that the company was subject to reasonable regulations in the exercise of the police powers of the city, and, so far as that involved any federal question, such question was correctly decided.

The federal Supreme Court says that it is unable to accede to the contention that the company was entitled, by contract with the state, to lay electric wires underground without reference to the directions or regulations of the city on that subject, or that the street commissioner was obliged to permit it to excavate the streets for that purpose without the assent of the Board of Public Improvements or of the Municipal Assembly, or effort to obtain either, to the mere covenant of the company that it feared it might thereby subject itself to requirements from which it insisted it was exempt by the terms of its charter.

If the company, as it asserted, possessed the right to place electric wires beneath the surface of the streets, the court declares that right was subject to such reasonable regulations as the city deemed best to make for the public safety and convenience, and the duty rested on the company to comply with them.

If requirements were exacted or duties imposed by the ordinances, which, if enforced, would have impaired the obligations of the company's contract, this did not relieve the company from offering to do those things which it was lawfully bound to do.

The exemption of the company from requirements inconsistent with its charter could not operate to relieve it from submitting itself to such police regulations as the city might lawfully impose.

And until it had complied, or offered to comply, with regulations to which it was bound to conform, it was not in a position to assert that its charter rights were invaded, because of other regulations which, though applicable to other companies, it contended would be invalid if applied to it.

National Electric Light Convention, Chicago, June 7th, 8th and 9th.

The most popular line from Cincinnati, Louisville and all points South to Chicago is the Big Four Route via Indianapolis; magnificent sleeping cars and unequaled dining-car service. For maps, rates, etc., address E. O. McCormick, passenger traffic manager, Big Four Route, Cincinnati, O.

CORRESPONDENCE.

New York Notes.

New York, May 23.—The tedious negotiations between the Rapid Transit Commssion and the Manhattan Railway company are still in the air; the correspondence has led to no definite conclusion. The Manhattan directors express their willingness to accept six out of the seven franchises offered to them, provided the terms of compensation are readjusted to meet their approval and that "other necessary modifications" are made. The Rapid Transit commissioners regard this proposition as vague and entirely unsatisfactory. Mr. Orr, their president, in the latest letter to Mr. George J. Gould, expresses their position as follows: "The board made a definite proposition to your company, containing all necessary engineering and legal details, when it tendered to you the seven franchises referred to in our earlier correspondence. This tender has been absolutely refused by you as regards the Seventh or Amsterdam avenue franchise. But your letter seems to imply a willingness to accept the remaining six franchises, provided the compensation be readjusted, the time of construction be left indefinite, and subject, as you write, to certain 'other necessary modifications.' The board cannot act upon a proposition so vague, nor will it, in any event, grant a mere option to occupy the streets. But if you will comply with the request contained in my letter of the 13th inst., and will amend the text of the six franchises already tendered to you in such manner as to obviate the indefiniteness of your letter and to show (excluding only the question of compensation) exactly what contract you are willing to make with the city, the board will at once consider your counter-proposition, and will discuss with you the question of compensation with an unbiased mind, in the desire of reaching some solution which will be fair to you and of benefit to the city. But unless your company is willing, in the reasonable manner thus suggested, to submit to our board a counter-proposition which shall be complete in all its details, and which shall thus show exactly what benefit the community may expect to receive from your action, it would appear to be futile to continue the negotiation." M. S.

PERSONAL

Mr. Hugo Diemer, formerly of Diemer & Hebble, Cincinnati, has accepted a position with the Westinghouse Electric and Manufacturing company at Atlanta, Ga.

W. R. Mason, representative of the Walker company at St. Louis, was in Chicago early in the week. Mr. Mason has two years in the naval reserve force that has just left Chicago for the front.

Ben Williams, one of the leading life-insurance men in Chicago, with a wide acquaintance among electrical men, died last week. Mr. Williams was a member of the old Chicago Electric Club and at one time was active in its affairs. He was a man of many friends, and his death is keenly regretted.

Dr. H. S. Carhart, the professor of electrical engineering in the University of Michigan, was a visitor in Chicago early in the week. Professor Carhart states that the patriotic spirit is high at the university. Two professors and about 100 students have left their books to serve in the army or navy, and several companies are drilling at home.

ELECTRICAL SECURITIES.

The Nassau Electric Railroad company has improved its condition materially since the first of the year. During that period the gross earnings were $419,378, an increase of $84,833 over the corresponding period of last year.

The Brooklyn Heights Railroad company's report for the quarter ended March 31st shows gross earnings of $1,058,169, an increase of $68,466, and operating expenses $697,710. The net earnings were $360,459, an increase of $15,704. The company's business has steadily improved since July 1st, the surplus being increased $43,543 in that time.

The Edison Electric Illuminating company of New York reports gross earnings for April of $260,609, an increase of $54,466 as compared with the

same month of last year, and net $120,796, an increase of $19,952. For the four months ended April 30th, the gross earnings were $1,079,772, an increase of $212,656 as compared with the corresponding period of last year, and net $498,983, an increase of $73,168.

MISCELLANEOUS.

"Useful Information for Practical People" is the attractive title of a vest-pocket book issued by Foree Bain of Chicago. It contains practical hints and valuable data in concise form which can be readily understood by the layman as well as the engineer, and there is a good deal of useful information for those not engaged in engineering occupations.

The United States consul at St. Gall reports that in the following-named cities in the German Empire the municipal authorities own and manage the electric works that supply light and power: Bremen, Barmen, Cassel, Darmstadt, Düsseldorf, Elberfeld, Hanover, Cologne, Königsburg, Lübeck and Pforzheim. All of these cities, with the exception of Hanover, also own the gas-works. The following-named cities have constructed electric works for the purpose of furnishing light and power, but have leased them to private operators: Aix-la-Chapelle, Chemnitz, Frankfort, Strasburg and Stuttgart, all of which, with the exception of Chemnitz, are cities where the gas-works are under the management of private corporations. In the following-named cities private companies have established electric works with the agreement that, under certain conditions, the municipal authorities shall have the privilege of securing absolute control and ownership by purchase: Altona, Dessau, Gera, Hagen, Heilbronn, Leipsic, Mülhausen, Stettin and Zwickau. Of these cities, the gas-works are under private control in Dessau, Hagen, Mülhausen and Zwickau.

TRADE NEWS.

Sipe & Sigler of Cleveland have received orders for Willard batteries from the Riker Electric Motor company of New York, and the Fischer Equipment company of Chicago for motor vehicles sold in Paris.

The American Telephone and Telegraph company has issued a "war atlas" which contains some excellent maps of the localities affected by the present trouble between Spain and this country.

The Buckeye Electric company finds its capacity unequal to the demand for the Buckeye double-anchored filament 220-volt lamp. Additional apparatus is being placed to meet the requirements. Consumers express satisfaction over the sustained candle power of this lamp.

The American Tool Works company of Cincinnati, Ohio, has received, through its office at London, England, orders from Wimhurst, Hollick & Co. of London, amounting to $12,000, including engine lathes from 14 to 22 inches swing, planers, radial drills, upright drills, bolt cutters, milling machines and chucking lathes; also an order from Pearson, Bennin & Co. of Leicester, England, for a number of engine lathes and upright drill presses.

Automatic telephone pay stations for the independent-telephone field have been put on the market by the Mason Telephone Pay Station company of Ludington, Mich. The instruments are said to be giving entire satisfaction. The Mason company will ship an instrument on 30 days' trial to any responsible telephone company, and if not found satisfactory, it may be returned at the Mason company's expense. Full particulars will be cheerfully sent on request.

The Centralia (Ill.) Coal and Mining company has purchased, through G. P. Nichols & Bro. of Chicago, the western agents of the Jeffrey Manufacturing company of Columbus, a complete electrical outfit for coal mining, consisting of five standard electrical chain breast coal-mining machines, one 10-ton electric locomotive of 30-inch gauge, three electric drills, one 250-volt 120 kilowatt generator, and a 200 horse power engine. It is said that the electric mining locomotive of the Centralia company will be the first to be put into service in this state.

BUSINESS.

The American Stoker company, Washington Life building, New York, announces a new catalogue, which will be sent to anyone desiring a copy.

The Jandus Electric company's enclosed alternating arc lamp is said to be a trade-getter for central stations. Several instances have developed, where non-users of electric light have been brought into line by the splendid illuminating power and all-around serviceability of this lamp. The trade adjacent to Chicago is supplied with catalogue, price, etc., on application to 753 Monadnock building, Chicago.

The Automatic Switch company of Baltimore, Md., manufacturer of automatic starting apparatus for pumps, elevators, etc., has appointed the following-named agents: For New York city and New Jersey, D. H. Darrin, Vanderbilt building, New York; for Michigan, Wisconsin, Illinois, Indiana and Iowa, Harding & Hammer, Marquette building, Chicago; for Louisiana, Vincent Gray, New Orleans.

Barber shop, bath, ladies' maid, stock reports, stenographer and typewriter, and other distinctive features originated on the Pennsylvania Short Lines are retained on the New Pennsylvania Limited which leaves Chicago 5:30 p. m. daily over that route for New York. The new service possesses every possible improvement. For full information address H. R. Dering, assistant general passenger agent, 248 South Clark street, Chicago.

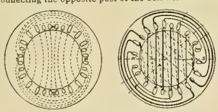
The Electric Appliance company has recently concluded the general distribution of its fan catalogue for the season of 1898. In sending out catalogues to a large list of buyers, it is often the case that some are overlooked. The Electric Appliance company would be pleased to hear from any consumer who has not received a copy of this handsome catalogue, as it is anxious to place the catalogue in the hands of every possible user or purchaser of fan motors.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued May 17, 1898

604,033. Electrical Safe Protection System. Isaac Freed, Harrisburg, Pa. Application filed June 15, 1897.

A safe is provided with two contact points, a conductor extending from one point to the other point and including one or more switches, the bottom and the closed circuit embracing the spring fingers and the switch in combination with the alarm box, the magnet core and its armature forming a part of the closed circuit, the battery and conductor connected to the armature, the contact screw, located in the path of the armature, the switch, the conductor connecting switch and screw, the alarm bell, the conductor connecting one post of switch and bell, and the conductor connecting the opposite post of the bell with the battery.



NO. 604,055.

604,055. Electromagnet Having Rotating Fields. Walter Langdon-Davies, London, England. Application filed May 23, 1896.

A field magnet for an electric motor or transformer is described consisting of a substantially cylindrical magnetic core, wound with coils of wire encircling varying amounts of the cylindrical field space, the coils being distributed upon the cylinder in due proportion to the magnetic reluctance to be overcome in the central field space, so as to produce a field of substantially uniform density.

604,081. Electric-lighting System for Railway Cars. Willard F. Richards, Buffalo, N. Y. Application filed September 16, 1897.

The driving axle is provided with a pulley; the dynamo is provided with a pulley and capable of movement toward and from the driving axle in a substantially horizontal direction, and a driving belt is applied to the pulleys; a pressure device is attached to the car and presses the dynamo away from the driving axle, whereby the pressure is applied to the belt for producing the desired normal speed of the dynamo shaft irrespective of the weight of the dynamo, while the latter is moved toward the axle when the speed increases above that which produces the desired normal speed of the dynamo, causing a slip of the belt which neutralizes the excess of speed of the axle.

604,082. Electric-lighting System for Railway Cars. Willard F. Richards, Buffalo, N. Y. Application filed September 22, 1897.

The dynamo is provided with a pulley, and a driving belt is applied to pulleys; a fluid-pressure mechanism is connected with the movable dynamo and is pressed away from the driving axle to tighten the belt, while the dynamo is drawn toward the axle by an excessive speed of the belt.

604,083. Electric lighting Apparatus for Railroad Cars. Willard F. Richards, Buffalo, N. Y. Application filed September 25, 1897.

Claim is made for the combination with a car body, a car truck and its axle, and a dynamo driven from the axle, of a support on the car body by which the dynamo is carried and which permits of the lateral movement of the dynamo with reference to the car body, and a connection from the dynamo to the car truck by which the dynamo is caused to remain in alignment with the car axle.

604,084. Electric-lighting Apparatus for Railway Cars. Willard F. Richards, Buffalo, N. Y. Application filed October 11, 1897.

One claim is given: The combination with the car body and a car axle of a longitudinal track or way arranged on the under side of the car body, a carriage mounted on the track and carrying a dynamo, a horizontal socket mounted on the carriage, a tubular follower applied to the socket, a tension spring arranged in the socket and follower, an adjusting screw engaging with the follower, and an upright operating shaft geared with the adjusting screw.

604,085. Electric-lighting Apparatus for Railway Cars. Willard F. Richards, Buffalo, N. Y. Application filed October 14, 1897.

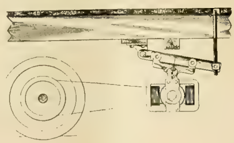
The combination is claimed with a railway vehicle and its axle of a longitudinal track or way arranged on the under side of the vehicle, a dynamo mounted on the track and capable of moving toward and from the car axle, a frictional driving mechanism whereby the dynamo is driven from the car axle, a horizontal cylinder supported by the vehicle, a piston arranged in the cylinder and connected with the dynamo, and means for delivering fluid under pressure to the cylinder.

604,094. Telephone-switchboard Plug. James Taylor, Heathercliffe Helsby, England. Application filed November 21, 1896.

This device comprises a metal bolt having a head at one end with an insulating sleeve, and having one end enlarged to form a washer lying adjacent to the head of the bolt, a metal sleeve on the insulating sleeve being provided with a collar at one end lying adjacent to the washer of the insulating sleeve and having a tongue at the opposite end, an insulating ring or washer on the metal sleeve adjacent to the collar thereof, a second metal tube forming the body of the plug having one end smaller than the other, a second insulating sleeve on the second metal tube, one portion of the latter sleeve fitting within the smaller portion of the second metal tube, and the other portion fitting in the larger part of the latter tube, an insulating washer on the smaller end of the second insulating sleeve and a nut on the bolt to secure the various parts thereon, and an insulating casing secured to the body of the plug.

604,098. Rail Conductor for Electric Systems. Louis E. Walkins, Springfield, Mass. Application filed August 18, 1897.

The combination is described of several rails in end-to-end arrangement, an intermediate one consisting of two opposite longitudinally ranging metallic sections and an intermediate rail of non-conducting material supporting and insulating the sections, end portions of the intermediate rail overlying the ends of the metallic sections and serving to insulate the respective metallic side sections at their ends from the rails adjoining the ends of the intermediate sectional rail.



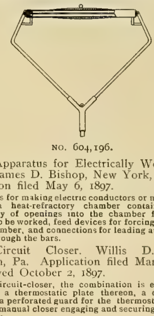
NO. 604,101.

604,101. Electric-lighting Apparatus for Cars. Edward Wilhelm and Willard F. Richards, Buffalo, N. Y. Application filed October 23, 1897.

An inclined track or way is arranged on the under side of the vehicle, a dynamo is supported on the track and capable of moving thereon toward and from the axle, and a frictional driving mechanism whereby the dynamo is driven from the axle.

604,128. Electrical Apparatus for Operating Elevator Doors. Humphrey R. Smith, Chicago, Ill. Application filed April 14, 1897.

The arrangement comprises the following features: A motor comprising a sectional solenoid, a movable core therefor, a circuit for the coils of the solenoid, the circuit controllable from the car and means for successively cutting out of the circuit and for progressively cutting into the circuit certain of the sections or coils, the means actuated by the movements of the core in combination with a door and connections between the door and core.



NO. 604,196.

604,137. Apparatus for Electrically Working Metals. James D. Bishop, New York, N. Y. Application filed May 6, 1897.

Means for making electric conductors or metal wire comprise a heat-refractory chamber containing a die, a plurality of openings into the chamber for bars of the metal to be worked, feed devices for forcing the bars into the chamber, and connections for leading an electric current through the bars.

604,157. Circuit Closer. Willis D. Kennedy, Easton, Pa. Application filed March 25, 1895. Renewed October 2, 1897.

In a circuit-closer, the combination is effected with a base of a thermostatic plate thereon, a central manual closer, a perforated guard for the thermostat, and a cap for the manual closer engaging and securing the guard on the base.

604,196. Trolley for Electric Railways. Sidney H. Short, Cleveland, Ohio. Application filed September 26, 1896.

The cut shows a familiar form and the claims contain the following: The combination of a motor car and an overhead conductor, with a trolley arm mounted on the car by means which permit the vertical movement but prevent the lateral movement of the upper end of the trolley arm, a horizontal cylindrical roller mounted on the upper end of said trolley arm and a convex sleeve secured upon said roller between its ends.

604,219. Electric Arc Lamp. Frank W. Steinacker and Edwin F. Cowley, Cleveland, Ohio. Application filed April 12, 1897.

In the construction of this lamp there are employed a stationary tube, a clutch below the same, a movable tube adapted to stand within the stationary tube and adapted to project downward beyond the clutch while in engagement with the stationary tube, the movable tube contacting with the stationary tube and receiving current from it and a movable carbon carried by the movable tube.

604,258. Apparatus for Joining Telegraph Cables. Henri Menier, Paris, France. Application filed December 28, 1897. Patented in France May 11, 1897.

The apparatus described for completing telegraphic cable joints comprises an elastic cylinder to inclose the cable joint, hollow chambers about the cylinder and means for admitting fluid pressure to the chambers to compress the cable joint.

Western Electrician.

EVERY SATURDAY.

Vol. XXII. CHICAGO, JUNE 4, 1898. No. 23

President Samuel Insull.

The presiding officer of the twenty-first convention of the National Electric Light association, which will be held in this city next week, will be Mr. Samuel Insull, who was elected to the presidency of the organization at the Niagara Falls gathering in June last year. An excellent portrait of President Insull, reproduced from a recent photograph, adorns this page. His features are familiar to the electrical fraternity, in spite of his aversion to all kinds of publicity, owing to the conspicuous position he has occupied in the electrical manufacturing and central-station business of the country. For many years he was closely identified with Mr. Edison and looked after the latter's commercial interests, relieving him of business cares and permitting him to devote his entire attention to the experimental work in which he was engaged.

Mr. Insull was born in London on November 11, 1859, and came to this country in March, 1881. He had been actively engaged in promoting Mr. Edison's European interests before coming to the United States, especialy in the field ot telephony, and in this work had been associated with Edward H. Johnson of New York, through whose solicitation Mr. Insull came to this country to act as private secretary for Mr. Edison. Mr. Insull found Mr. Edison completely occupied with experimental work that ultimately resulted in the development of the central-station system which bears the great inventor's name.

When Mr. Edison had succeeded in producing a commercial lamp and had designed generating apparatus and the necessary fixtures for utilizing them, it was determined to organize a manufacturing business to produce the necessary equipment. This task was assigned to Mr. Insull, although he was then without experience in manufacturing business of any kind. The Edison shops comprised three or four enterprises which Mr. Edison controlled and were conducted under the personal supervision of Mr. Insull. The business prospered, and it was soon found necessary to make provision for larger works. This led to the establishment of the Schenectady works, which were opened on Christmas Day in 1886. They were built during Mr. Insull's administration, and were run by him until the organization of the Edison General Electric company. In the formation of that concern Mr. Insull was made second vice president. He was placed in charge of the manufacturing department, and afterwards was given charge of the selling department also, thus placing him in absolute control of the company, aside from the financiering of the institution. When the Edison General Electric company was consolidated with the Thomson-Houston interests in the General Electric company Mr. Insull was elected second vice-president, but he immediately resigned, and really had no part in the management of that corporation.

Upon his retirement from the manufacturing business Mr. Insull entered the central-station field. He accepted the presidency of the Chicago Edison company, and has since directed the affairs of that corporation. Its development has been as remarkable as the other enterprises with which he has been identified. It might be mentioned that the Chicago Edison company holds a perpetual license from the Edison Electric Light company of New York to use its patents in Cook county, Ill. Its principal station on Harrison street, where the greater portion of its output of electrical current is manufactured, is one of the most complete in the United States. It has three other central stations. During Mr. Insull's management the company has made numerous additions and extensions. His aim has been to secure as nearly as possible complete control of the electric-lighting business of the city. With this purpose he consummated the absorption of the Chicago Arc Light and Power company, the Chicago Illuminating company and several smaller concerns that had been operating in the same territory as the Chicago Edison company. He also secured control of the companies that supplied current outside the "Edison district" and thus secured immunity from competition. The Hyde Park Thomson-Houston company was purchased by interests friendly to the Edison company, and Mr. Insull became president. In November, 1897, the capital stock of the Englewood Electric Light company was purchased in the same interest and Mr. Insull became the president of that company. About the same time the Western Light and Power company, having a 1,200 horse power plant and an extensive lighting business in Lake View, was purchased by interests friendly to the Edison company. The West Side Electric Light and Power company and several other small concerns were added to the list of companies controlled by the Chicago Edison company and friendly interests. It was deemed advisable to organize the outside companies into one concern, and accordingly they were consolidated under the name of the Commonwealth Electric company and will be operated under the franchise bearing that name. This consolidation, which secures harmony in the operation of the electric-lighting interests of Chicago, was brought about by Mr. Insull, and is deservedly considered a notable achievement in the electrical and financial world.

PRESIDENT SAMUEL INSULL

Mr. Insull is interested in several other enterprises, but these do not occupy much of his attention. He has given a great deal of time and thought to the National Electric Light association since his election to the presidency and has done much to remove the friction that formerly was noticeable between the Edison interests throughout the country and the companies employing other types of apparatus.

Mr. Insull is a firm believer in everything that bears the name of Edison, and he has been a powerful factor in the Association of Edison Illuminating Companies, of which he is now the president. The Edison companies of the country, it may be mentioned, are formed upon the same general plan, and their conventions are more in the nature of family conferences than anything else. Their sessions are held behind closed doors, and business matters of considerable importance are freely discussed there.

It will be understood at once that the objects and scopes of the National and the Edison associations are entirely different, and there seems to be no reason why they should conflict, yet it is known that they have not worked in harmony heretofore, and President Insull has striven to remove all such differences during his administration.

Mr. Insull is a member of several other organizations, including the Chicago club and the Fellowship club. He is also a member of the Institution of Electrical Engineers of London, and frequently visits his old home. He is, however, thoroughly American, and it may be added, that he is the personification of Chicago enterprise and persistence. His remarkable success is no doubt largely due to these characteristics in combination with a rare executive ability and knowledge of men.

Mr. Insull's loyalty to Mr. Edison and his deep admiration for and confidence in the ability of the great inventor have often been remarked by those who are familiar with him. It is true, too, that Mr. Edison entertains a high opinion of Mr. Insull's ability and fully appreciates the value of the services rendered him when careful management and close attention to the details of the Edison business were mostly needed. The uninterrupted friendship which has existed for so many years between these men is often the subject of comment among those who are familiar with their personal traits. Two more dissimilar characters could hardly be imagined, yet they thoroughly understood and appreciated each other, and Mr. Insull attributes much of his success to Mr. Edison and the opportunities that came to him because of their friendship

NATIONAL ELECTRIC LIGHT ASSOCIATION.

For the third time in the history of the National Electric Light association the convention of that organization will be held in Chicago on June 7th, 8th and 9th. In a measure the association may be considered a Chicago institution, as the principal promoters of the movement that eventually resulted in its formation were identified with the electrical interests of this city, the preliminary meetings were held here and the organization was finally perfected at the convention held in this city on February 25 and 26, 1885. This was the first formal gathering of the new association.

The next time the members honored Chicago by assembling in this city was in February, 1889. On that occasion the meeting was held at the old Exposition on the lake front, which has since been removed to make way for the beautiful home of the Art Institute. The second Chicago meeting was the most successful electrical gathering that had ever been held, and the exhibition of electrical apparatus of all descriptions that was made in connection with the convention was largely attended and served to attract public attention to the multifarious duties which electricity was prepared to perform.

Those who attended the early meetings of the association will probably be interested in making comparison with this year's gathering. It will be found that the association reflects in its annual conventions the changes that have taken place in the business. The "boom" days have been succeeded by a period of conservative tendency. The electric-lighting business to-day is conducted on strictly commercial lines, and its representative organization is simply a gathering of technical and commercial experts of the industry.

The convention headquarters of the association will be at the Auditorium, and the meetings will be held in the banqueting hall. Following is the official programme for the convention:

TUESDAY, JUNE 7, 1898.

Meeting of the executive committee at 9 a. m., secretary's office, Auditorium Hotel.

Morning Session, 10:30 O'Clock.

Address: President Insull.

Paper: "Cost of the Generation and Distribution of a Unit of Electricity," by Calvin W. Rice, Brooklyn, N. Y.

Topic: "Prices and Discounts for Electric Current and Methods of Billing Current to Customers."

Afternoon Session, 2 O'Clock

Paper: "Public Lighting with Relation to Public Ownership or Control," by Alex Dow, Detroit, Mich.

Topic: "Legislative Policy as to Public-service Corporations."

WEDNESDAY, JUNE 8, 1898.

Morning Session, 10 O'Clock.

Paper: "General Distribution from Central Stations by Alternating Currents," by Herbert A. Wagner, St. Louis, Mo.

Paper: "General Distribution from Central Stations by Direct Currents," by Louis A. Ferguson, Chicago, Ill.

Topic: "Standardizing Apparatus for Central-station Use."

Afternoon Session, 2:30 O'Clock.

Paper: "Cost of Producing Electric Power by Water Power from Lachine Rapids, Canada," by W. McLea Walbank, Montreal, Canada.

Report of committee on "Standard Candle Power of Incandescent Lamps," by Dr. Louis Bell, chairman.

Questions and answers. What is it you wish to know?

Executive session.

Evening Session, 8 O'Clock.

Lecture: "Electricity Direct from Coal" (Illustrated with stereopticon), by Joseph Wetzler, New York.

THURSDAY, JUNE 9, 1898.

Morning Session, 10 O'Clock.

Paper: "Transformer Economy," by Professor Winder Elwell Goldsborough, Purdue University, Lafayette, Ind.

Report of committee on "Amendments to Freight Classification," by James J. Ayer, chairman.

Report of committee on "Legislation Concerning Theft of Current," by James J. Ayer, chairman.

Afternoon Session, 2:30 O'Clock.

Topic: "Freight Rates on Electrical Apparatus."

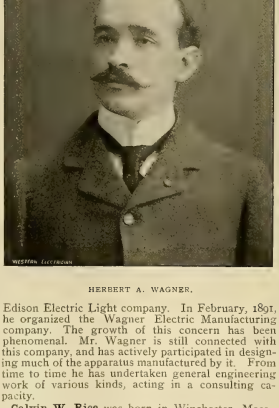
Report of committee on finance, by John A. Seeley, chairman.

Executive session.

Election of officers.

Portraits, accompanied by brief biographical sketches of the gentlemen who will read papers during the convention are herewith presented. It should be mentioned that Mr. Ferguson, who will contribute a paper on the subject of "General Distribution from Central Stations by Direct Currents," has taken a prominent part in the arrangements for the reception and entertainment of convention visitors, and his portrait and biographical sketch are presented with other members of the local committee.

Herbert A. Wagner was born in Philadelphia on February 24, 1867. He received his education at Stevens Institute of Technology, where he was graduated as mechanical and electrical engineer in June, 1887. He entered the service of the Westinghouse Electric and Manufacturing company at Pittsburg in September, 1887, and after spending about a month in the Pittsburg factories was sent West by the company to supervise the installation of electric-light plants in a number of western cities. This experience proved valuable to him when he was sent to St. Louis in the summer of 1888 to assist in the organization of an electric-light company, which was to purchase apparatus from the Westinghouse company. As a result the Missouri Electric Light and Power company was incorporated in 1889, and work was at once begun on the installation of a large central station under his supervision. In 1890 he withdrew from the Westinghouse company to enter the service of the local central-station company as general superintendent. He has retained this position throughout the different reorganizations and consolidations of the local companies, which finally resulted in the incorporation of the Missouri-



HERBERT A. WAGNER.

Edison Electric Light company. In February, 1891, he organized the Wagner Electric Manufacturing company. The growth of this concern has been phenomenal. Mr. Wagner is still connected with this company, and has actively participated in designing much of the apparatus manufactured by it. From time to time he has undertaken general engineering work of various kinds, acting in a consulting capacity.

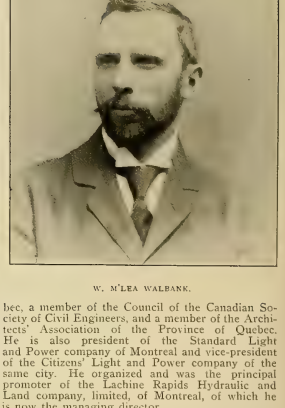
Calvin W. Rice was born in Winchester, Mass., a suburb of Boston. After graduating in the course of electrical engineering from the Massachusetts Institute of Technology, he entered the Lynn works of the Thomson-Houston Electric company, and in four years was advanced to the position of assistant engineer of the motor department. At the time of the consolidation of the Thomson-Houston Electric company and the Edison General Electric company, he was made assistant engineer of the power and mining department of the General Electric company. From Schenectady he was transferred to the more responsible position of district engineer at Cincinnati, O. From 1895 to the beginning of the present year Mr. Rice has been engaged as consulting engineer on long-distance transmission propositions for lighting and power in Colorado and Montana.

Last year, in trips aggregating over 20,000 miles, he completed a tour of visitation to all the principal electric plants in the United States and many in Canada.

He is now electrician of the Kings County Electric Light and Power company of Brooklyn, of which A. M. Young is general manager and E. F. Peck superintendent.

Alex Dow was born in Glasgow, Scotland, in 1852, and was educated in the public schools. He was employed in railroad and steamship offices in Scotland, England and the United States from 1874 until 1883, and then held a position with the Baltimore and Ohio Telegraph company until 1887, first in office work and afterwards in charge of city lines in Baltimore. Then for a year he was engaged with central stations and construction companies as lineman, wireman and general utility man. From October, 1888, until June, 1893, he was employed by the Brush Electric company, having charge of the expert and engineering work at the Chicago office of that company. During that period he was an occasional contributor to the Western Electrician and took a prominent part in the discussions at the Chicago Electric club. In July, 1893, he was appointed electrical engineer of the Public Lighting Commission of Detroit, and for three years occupied that position, that period covering the construction and the first 15 months of operation of the city lighting plant. For the last two years he has been general manager of the Edison Illuminating company of Detroit, and has also carried on a business as a consulting engineer. Mr. Dow is a member of the American Society of Mechanical Engineers and the American Institute of Electrical Engineers and a vice-president of the Detroit Engineering society.

W. McLea Walbank was born in St. Johns, Newfoundland, and was graduated in applied science in the department of civil and mechanical engineering, McGill University, Montreal, in 1877. He was admitted to the practice of provincial land surveying for the province of Quebec in 1878, and has since been identified with that profession. He was a member of the Canadian Society of Civil Engineers at its formation in 1887, and is now president of the Provincial Land Surveyors of the Province of Que-



W. M'LEA WALBANK.

bec, a member of the Council of the Canadian Society of Civil Engineers, and a member of the Architects' Association of the Province of Quebec. He is also president of the Standard Light and Power company of Montreal and vice-president of the Citizens' Light and Power company of the same city. He organized and was the principal promoter of the Lachine Rapids Hydraulic and Land company, limited, of Montreal, of which he is now the managing director.

Joseph Wetzler was born at Hoboken, N. J., December 6, 1863, and received his early education at the Hoboken Academy, where he graduated at the head of his class. Mr. Wetzler entered the Stevens Institute of Technology, where he pursued the four years' course, and took the degree of mechanical engineer in 1882. He entered the works of Edward Weston at Newark, N. J., and gained much practical experience, after which he was engaged for a short term on the editorial staff of the Scientific American, and then assumed the editorship of the Electrical World. In April, 1890, he took the editorial management of the Electrical Engineer. Mr. Wetzler is the joint author with T. C. Martin of "The Electric Motor and Its Applications," a pioneer work, which has already passed through numerous editions. With Mr. Martin he also assumed in 1891 the editorship of the electrical section of the new edition of Appleton's "American Cyclopædia of Applied Mechanics." To Scribner's Magazine he contributed the electric-railway article in the series since published in book form.

Mr. Wetzler has always been interested in educational work, and his latest effort has resulted in the formation of the Electrical Engineer Institute of Correspondence Instruction, of which he is the president.

Mr. Wetzler was one of the earliest members of the American Institute of Electrical Engineers, has

been an active member of its council for several years, and also occupied the office of vice-president. He was a delegate from that body to the Paris Electrical Congress of 1889. For many years he acted as secretary of the New York Electrical society, then became its vice-president and finally its president. Mr. Wetzler has also been a vice-president of the Stevens Institute Alumni association and is a member of the American Association for the Advancement of Science, the London Institution of Electrical Engineers and the Vienna Elektrotechnische Verein.

In the intervals of his professional work, and as an aid to it, Mr. Wetzler has found time to cultivate languages, and, besides being thoroughly conversant with English, German and French, has a useful knowledge of Spanish and Italian.

Winder Elwell Goldsborough is the director of the School of Electrical Engineering at Purdue University, Lafayette, Ind. He has been actively engaged in electrical work for six years, having graduated from the mechanical engineering department of Cornell University in 1892, and immediately thereafter accepted the position of electrical engineer to the Colliery Engineer company of Scranton, Pa., which he resigned to accept a call to the Arkansas University. There he pushed the development of the electrical laboratories and the course in electrical engineering.

Mr. Goldsborough was called to Purdue University in the capacity of associate professor of electrical engineering in 1894, and was appointed to the directorship of the School of Electrical Engineering in 1896. His connection with the commercial interests of the country has been chiefly in the capacity of advisory engineer in conducting economy tests and in designing plant equipments. Under his direction efficiency tests have been conducted on the electric mining plants of Brazil, Ind., the municipal plant of Logansport, Ind., the plant of the Edison Electric Illuminating company of Baltimore and numerous others.

Professor Goldsborough is a member of the American Association for the Advancement of Science, the American Institute of Electrical Engineers, the Society for the Promotion of Engineering Education, the Society of Mechanical Engineers and the Indiana Academy of Science. He is the author of a number of scientific papers and has traveled in Europe and the far East. His latest contribution to electrical literature was a paper before the American Institute of Electrical Engineers on April 27th, entitled "An Economy Test of a Central Station," giving the result of his study of the Baltimore plant in 1895. It was a very comprehensive paper and attracted considerable attention.

Officers of the Association.

The present officers of the association are: President, Samuel Insull, Chicago, Ill.; first vice-president, A. M. Young, Waterbury, Conn.; second

WINDER ELWELL GOLDSBOROUGH.

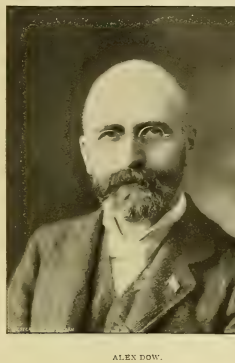
vice-president, George R. Stetson, New Bedford, Mass.; secretary and treasurer, George P. Porter, New York; master of transportation, C. O. Baker, Jr., Newark; executive committee: W. R. Gardener, G. A. Redman, H. A. Wagner, John A. Seely, A. J. DeCamp, E. H. Stevens, F. A. Gilbert, W. W. Dean and W. McLee Walbank.

The craze for automobile vehicles is reported to have reached a high pitch in Paris. Automobile carriages and tricycles are to be seen everywhere in the streets of that city, and the supply falls so far short of the demand that prices have gone up materially. The best makes are said to have more orders on their hands than they can fill in two years.

Entertainment of Visitors.

The local electrical interests will provide entertainment for the visitors, and special attention has been given the arrangements for the ladies who will accompany the delegates. The principal feature of this programme is a reception at the Auditorium Hotel, Monday evening, from 8 o'clock to 10:30. Wednesday evening will be occupied with a popular lecture by Joseph Wetzler of New York on "Electricity Direct from Coal." The coaching parties arranged for the ladies during the day, when the men will be engaged in the sessions of the convention, will no doubt prove a very attractive feature of the entertainment.

The following-named gentlemen, comprising rep-



ALEX DOW.

resentatives of the electrical interests of Chicago, were appointed a reception committee: C. H. Wilmerding, chairman; Samuel Insull, J. Holt Gates, J. B. O'Hara, L. A. Ferguson, J. B. Wallace, F. E. Donohoe, J. R. Wiley, M. Coster, F. B. Badt, L. K. Comstock, Charles Munson, M. J. Insull, F. W. Kohler, W. A. Kreidler, W. H. McKinlock, G. A. McKinlock, B. E. Sunny, W. W. Low, F. H. Clark, F. S. Gorton, E. B. Kittle, George C. Bailey, A. S. Hibbard, James Wolff, H. R. Hixson.

From this committee a sub-committee of five, to be known as the entertainment committee, was selected to make the necessary arrangements for the meeting. This committee is composed of Messrs. Wilmerding, Sunny, Ferguson, Wallace and Coster, and they have certainly acquitted themselves creditably. Brief sketches of these gentlemen, whose portraits are herewith presented, are appended:

C. H. Wilmerding, chairman of the reception committee and also of the entertainment committee, is an ex-president of the National Electric Light association and has long been identified with the work of the organization. He made an excellent record as executive officer of the association, and it was during his administration that the first electrical show was organized in New York. He was also president of the Illinois state association of central-station companies formed in this city several years ago. Mr. Wilmerding is 40 years of age, a native of New York, an engineer by profession, but he has had valuable executive experience in central-station management and in commercial work. He was for many years connected with the Chicago Arc Light and Power company and the Chicago Edison company, and is now engaged in engineering work and selling agent for the Crocker-Wheeler company in the West. A biographical sketch of Mr. Wilmerding will be found in the Western Electrician of May 9, 1896.

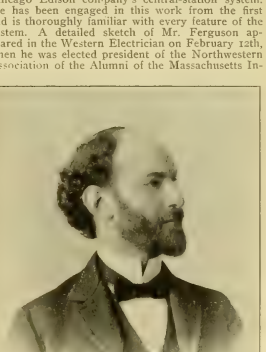
As chairman of the entertainment committee Mr. Wilmerding has had charge of the arrangements for the reception and entertainment of the visitors during the convention, and it will not be necessary to give any further assurance that the preparations for the social features are all that could be desired.

B. E. Sunny, manager of the Chicago office of the General Electric company, will be remembered by the members of the National Electric Light association who attended the last meeting in Chicago in February, 1889, as he was chairman of the executive committee which had charge of the arrangements for that successful meeting. Mr. Sunny was then identified with the old Thomson-Houston company and he was also president of the Chicago Arc Light and Power company. Both of those corporations have since been absorbed, the latter by the Chicago Edison company and the former by the General Electric company.

Mr. Sunny's experience extends to every branch of the electrical business. He began life as a telegraph operator in New York, and, after three years' experience, removed to Chicago in 1875, where he secured a position with the old Atlantic and Pacific Telegraph company. The following year he was promoted to the position of night manager, and his ability and industry soon won further promotion. In 1877 he was appointed manager of the Chicago office, and continued in that position until the Atlantic and Pacific company became a part of the system of the Western Union Telegraph company in 1879, when he became superintendent of the operating department of the Bell Telephone company's exchange in Chicago. When the contest between the Bell and Edison companies ended in a victory for the former, in 1881, Mr. Sunny was continued as superintendent of the operating department of the consolidated companies, and five years later was also given direction of the construction department. On January 1, 1888, Mr. Sunny was elected president of the Arc Light and Power company of Chicago. He was appointed manager of the Thomson-Houston company on December 1, 1888. He has also been closely identified with the electric railway developments of Chicago and vicinity. During the life of the Chicago Electric club, Mr. Sunny was an active and influential member and held several offices in the organization, contributing largely to the valuable work performed by that society. He was also prominently identified with the electrical work at the World's Fair. He served one term as a member of the local directory and was a member of the committee on electricity. He was one of the leaders in the movement which resulted in keeping the fair open evenings.

Mr. Sunny is a native of Brooklyn and is 41 years of age. He is a member of the Union League club of Chicago and several other organizations. He is happily married and has a pleasant home on the North Side, Chicago.

Louis A. Ferguson, general superintendent of the Chicago Edison company, represents the local central-station interests upon the entertainment committee. He has been identified with this branch of the business for 10 years, and has attained considerable prominence, especially as an authority upon the design, construction, operation and management of central stations. Mr. Ferguson is a native of Boston, 31 years of age, a graduate of the Massachusetts Institute of Technology (class of '88), and is president of the Northwestern Alumni association of that institution. He is also a member of the Technical club of Chicago and during the life of the Chicago Electric club was an active member of that body. Mr. Ferguson's work can best be appreciated by those who are familiar with the development of the Chicago Edison company's central-station system. He has been engaged in this work from the first and is thoroughly familiar with every feature of the system. A detailed sketch of Mr. Ferguson appeared in the Western Electrician on February 12th, when he was elected president of the Northwestern Association of the Alumni of the Massachusetts In-



JOSEPH WETZLER.

stitute of Technology upon the eve of his departure for Europe. Mr. Ferguson has had the advantage of examining the latest electrical work abroad, especially in England, where there are many ambitious enterprises under way at the present time, and in his paper on "General Distribution from Central Stations by Direct Current," which he will read at the convention next week, he will embody the latest development in this line.

Mr. Ferguson has already contributed several valuable papers to the literature of American central-station practice, the latest being his admirable summary of "Central-Station Advancement," which appeared in the Western Electrician of January 22. He was one of the staff of lecturers of the University of Wisconsin in 1895, and presented a comprehen-

address on "Electrical Engineering in Modern Central Stations," which has since been published by the university. He read a paper at the meeting of the National Electric Light association at New York on May 5, 1896, on the "Commercial Value of Acetylene Gas as an Illuminant," giving the results of his experiments, made with Messrs. Wilson and Knapp at Spray, N. C., in May, 1895, in the production of calcium carbide and acetylene gas. The paper was published as a pamphlet by order of the association, and it is now considered one of the ablest contributions on the subject. His work in connection with Dr. Louis Bell and James I. Ayer upon the preparation of a suitable specification for a standard incandescent lamp and the determination of a proper method for the commercial application of this standard, has been highly commended. The result of this work was presented in a report on "Standard Candle Power of Incandescent Lamps" submitted to the National Electric Light association at Niagara Falls, on June 10, 1897. At the convention of the Association of Edison Illuminating Companies at Niagara Falls, September 14, 1897, Mr. Ferguson submitted an important contribution on "Economy in Distribution of Electric Energy," which provoked considerable discussion among the Edison experts.

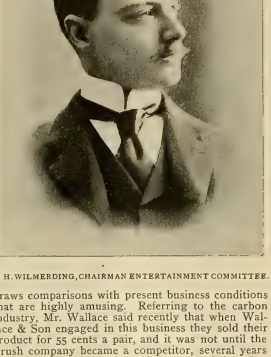
J. B. Wallace, who may be said to represent the manufacturers' agents on the entertainment committee, is a pioneer in the electric-lighting industry. As a boy he was interested in the experimental work which his uncle, William Wallace, conducted with Prof. Moses G. Farmer, at Ansonia, Conn., and it was only natural that he should continue in the same line. Mr. Wallace does not depend upon his family name for recognition by the electrical fraternity, however. One of his early achievements was the building of a telephone exchange in Waterbury in 1877, the third to be equipped in the country. It proved a successful venture and has since been developed by the Bell interests and enlarged to its present proportions. Mr. Wallace also built the first electric railway in New England. This line was owned by the Derby Street Railway company and extended to Ansonia and Birmingham. It is an interesting fact that an electric locomotive was employed upon this line to haul freight from Ansonia to the Derby docks, which is said to be the first authentic case where an electric locomotive was employed in commercial work.

Mr. Wallace was born at Ansonia, Conn., in 1858, and received his education at New Haven. As already mentioned, he manifested an interest in electrical experimental work at an early age, undoubtedly being attracted by the mystery which then surrounded the art. Moreover, his uncle, William Wallace, was a recognized authority among electrical men of the day and was a close friend of Moses G. Farmer. This naturally served to heighten the interest of young Wallace in the work,

E. E. SUNNY.

and he became associated with his father in the manufacture of electrical apparatus in 1876, when the firm of Wallace & Son was established. Among their first work was the building of the Wallace-Farmer dynamo, the historical machine which attracted so much attention at the World's Fair. The firm was the first to build dynamos, the first to light its factory electrically and the first to make carbons in this country, and, with the exception of Cornell University, the sole exhibitor of a dynamo at the Centennial in Philadelphia in 1876. It was in the factory of Wallace & Son that Mr. Edison first saw an electric light, and it was the subject of this sketch who showed it to Mr. Edison and Professor Barker of the University of Pennsylvania who were visiting William Wallace in Ansonia. It is also of historical interest that it was at this factory that Mr. Edison procured the first dynamos with which he began his now famous experiments, which eventually resulted in the development of his system of electric lighting.

In 1879 Mr. Wallace formed the Electrical Supply company, and in 1882 a Chicago branch was opened, which afterwards outgrew the original institution. Later the name was changed to the Ansonia Electric company, but in the financial crisis which swept away so many commercial institutions a few years ago the Ansonia company went down and was never revived. In the latter part of 1893 Mr. Wallace, in company with W. S. Hine, formed the Wallace Electric company in Chicago, and since then he has cultivated a large and influential acquaintance in the West. He recounts many interesting anecdotes from his early experience, and



C. H. WILMERDING, CHAIRMAN ENTERTAINMENT COMMITTEE.

draws comparisons with present business conditions that are highly amusing. Referring to the carbon industry, Mr. Wallace said recently that when Wallace & Son engaged in this business they sold their product for 55 cents a pair, and it was not until the Brush company became a competitor, several years later, that they were compelled to cut their price. The Brush people reduced the price to $142 per thousand.

Maurice Coster, manager for the Westinghouse Electric and Manufacturing company at Chicago, is another representative of the manufacturing interests on the local entertainment committee. Mr. Coster had been in Chicago only about three years, but he had been identified with electrical interests for several years previous and had a wide acquaintance throughout the country, especially among engineers, before joining the forces of the Westinghouse company 10 years ago. His experience has not been confined to this country or to one class of work. He was identified with several large projects in mechanical and mining engineering before entering the electrical field, and also had extensive knowledge of commercial development in South American and European countries. He has traveled extensively and acquired a fund of information that could not otherwise be obtained. Mr. Coster is of Holland extraction and is now in his 42d year. At the age of 16 he came to this country. He secured a scholarship at Stevens Institute of Technology, entering the sophomore class, and in 1877 was graduated with the degree of mechanical engineer. This was followed by a practical course in the machine shops of the Iowa Central Railroad company, and later at the Lake Shore railroad shops in Elkhart. His proficiency won for him the position of instructor in mechanical drawing for the Lake Shore apprentices. Mr. Coster's experience extended to every branch of the railroad business, even to firing an engine on the road. In 1879 he was induced to go to South America as engineer for a gold-mining company, but the work was not to his liking and he soon withdrew and became consulting engineer for sugar estates. He was also appointed manager of the large sugar refinery at Anna Regina, Essequibo Coast, British Guiana.

Returning to this country, he married in 1885 Miss Edith Beckell, daughter of Dr. Thomas Beckell of Albany, N. Y. Mrs. Coster did not like South America, and in the spring of 1889 Mr. Coster severed his business connections and took his wife to Europe, spending most of the time in Italy, where their first child was born in 1888. On his return to this country in October, 1888, Mr. Coster entered the engineering department of the Westinghouse company and had charge of the erection of many of the most important central-station plants installed by that company. In 1891 he was transferred to the selling department, where his engineering skill, combined with his former experience in commercial affairs, at once won promotion, and he was given charge of the Pittsburg territory. In 1895, however, Mr. Coster had the misfortune to lose his wife, and, at his request, he was transferred to Chicago on April 1st of that year. He came to this city as engineer for the Chicago office, but in January of the following year he was made manager of the Chicago district, which is one of the most important territories in the country, as it includes not only the city of Chicago, but northern Illinois and northern Indiana, Michigan, Wisconsin, Iowa, Minnesota, Nebraska, Montana and North and South Dakota. It is needless to say that Mr. Coster has made a creditable record in the management of the Chicago department and that he has gained many personal friends during his residence in this city.

Eastern Delegation.

It is expected that a large delegation from New York, Boston and other eastern points will attend next week's meeting. The passenger associations have granted the usual rate of a fare and a third, on the certificate plan, for delegates and their friends. Arrangements have been made to have the New York delegation leave the Grand Central station on Sunday, June 5th, at 1 p. m. on a special train over the New York Central, Hudson River and Michigan Central railroads. Stops will be made for passengers at Poughkeepsie at 2:43 p. m.; Albany, 4:20 p. m.; Schenectady, 5:05 p. m.; Utica, 7:03 p. m.; Syracuse, 8:35 p. m.; Rochester, 10:47 p. m.; Buffalo, 11:50 p. m. Central time; Detroit, 8:00 a. m., Monday, arriving in Chicago at 3 p. m. Monday. The train leaving Boston at 10:30 a. m. Sunday, June 5th, will connect with the New York train at Albany. In case the number of delegates attending should warrant, a special train will be run as a second section to the train named.

The Central Passenger association has granted an extension on tickets issued to members of the National Electric Light association to June 18th, so that persons holding them can go on Northwestern trip.

CONVENTION FEATURES.

The Electric Storage Battery company, through Mr. Frank H. Clark, the Chicago representative, has issued handsomely engraved invitations to the members of the National Electric Light association and others attending the convention to inspect the large new storage battery in the Edison building at 139 Adams street. A representative of the Electric Storage Battery company will take pleasure in explaining the operation of the battery to visitors. The invitation is, of course, extended through the courtesy of the Chicago Edison company, which is appreciated and acknowledged by Mr. Clark and his company. The Chicago office

LOUIS A. FERGUSON.

of the Electric Storage Battery company is at 1425 Marquette building.

The local committee of entertainment will establish a bureau of information at the Auditorium during the convention. The Chicago Telephone company kindly offered free local service and agreed to put in a long-distance instrument and furnish free service to the delegates and visitors.

S. Marsh Young, vice-president and general manager of the Manhattan General Construction company of New York, will be at the Auditorium Hotel in Chicago during the convention with a full line of the new Manhattan enclosed arc lamps. These lamps are designed to burn in multiple on circuits of from 90 to 250 volts, and two or more in series on circuits of from 200 to 600 volts, and on alternating-current circuits of from 90 to 130 volts, and any number of alternations.

Electrical and Insurance Interests.

At the time of the first meeting of the National Electric Light association in Chicago in 1885 the insurance companies looked upon the new industry as a dangerous factor, and the electric-lighting companies voted unanimously that the insurance interests were the natural enemies of progress and science. The conflicting interests continued to misunderstand each other and retard the advancement of the industry for several years, until finally an agreement was reached, and to-day they are working in harmony.

This new condition of affairs was brought about largely by the conferences between the underwriters' representatives and delegates from the several electrical and architectural organizations of the country. The credit for inaugurating the movement belongs to the National Electric Light association, and that organization also deserves praise for the energetic manner in which it engaged in the formulation and adoption of the agreement now existing between the electrical and insurance interests. It must be admitted that the latter met all these advances and displayed a desire to effect an amicable settlement.

William H. Merrill, Jr., who represented the insurance interests in these negotiations, is now the chief of the electrical bureau of the National Board of Fire Underwriters, electrician for the Western Insurance Union, covering 22 central western states and territories, and electrician for the Chicago Underwriters' association. He came to Chicago from Boston in 1893, where he had been engaged in electrical inspection work for the Boston Board of Fire Underwriters. He received his early training at the Massachusetts Institute of Technology, being a member of the class of '89. He was born in Warsaw, N. Y., in December, 1868, and is the son of W. H. Merrill, the editor of the New York World. He is the present lecturer on insurance rules at the Armour Institute of Technology and at the University of Wisconsin. He is a member of the electrical committee of the Underwriters' National Electrical association and of the National Conference of Standard Wiring Rules. The laboratory and offices of his bureau are at 157 La Salle street, Chicago. They were illustrated in the Western Electrician of April 3, 1897, and the scope and character of the work were fully described. This institution was organized through Mr. Merrill's efforts shortly after he came to Chicago, and has been built up to its present prominent position in electrical and insurance circles through his efforts. Mr. Franklin H. Wentworth, Mr. Theodore Varney, Mr. William S. Boyd and Mr. Benjamin H. Glover are associated with Mr. Merrill in this work.

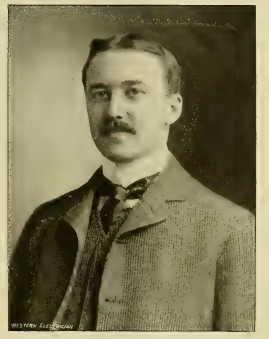
Mr. Merrill married in February of this year Miss Henderson, daughter of Mrs. C. M. Henderson, and resides at 1816 Prairie avenue. He is a member of the University and Washington Park clubs.

New York Electrical Exibition.

The show in Madison Square Garden was continued during the week, the date of closing being

I. S. WALLACE

postponed until June 4th. The attendance is said to have been large, and various novelties, including an "electrical wedding" in the Moore chapel, were prepared from day to day to appeal to the popular fancy. One incident, not down on the programme, is described in the New York Tribune of May 24th: "Thomas A. Edison, Jr., was the victim of an unintended experiment yesterday. The use of wireless telegraphy, as demonstrated in the Garden, has become a matter of comment, and its useful ness is acknowledged. While the mines in the tank have been used to blow up the miniature cruisers, another experiment has been under consideration for several days. It is that of throwing an electrical wave into the tank so that a particular mine can be exploded. The mines were placed in the tank yesterday before the show opened, and one not to be used was placed, apparently in safety, in Mr. Edison's desk, which was situated several feet from the border of the tank. Mr. Clarke, the man who sends the waves from the instrument in the gallery, was in charge of the sender, and Mr. Edison in charge of the receiver. As the wave was sent to the tank it spread, and, in spreading, caused an unlooked-for explosion, which demolished Mr. Edison's desk and destroyed many valuable papers. This startled everybody, and called for the immediate action of the fire brigade in the



WILLIAM H. MERRILL, JR.

Garden. The demonstration of the electrical wave was a most important one, and the discovery at this time of its liability to extend its radius when the full power of the wave is exerted will give Mr. Edison something to study out and Mr. Clarke something to think of."

Electrical Exhibition for Syracuse.

Among the visitors last week at the electrical exhibition in New York were General Benjamin F. Tracy, who was the guest of C. O. Baker, Jr., president of the Electrical Exhibition company, and a committee of the officers of the New York

MAURICE COSTER

State Agricultural society. The committee was received and shown through the building by President Baker and Mr. Nathan, the general manager. The object of the committee's visit was to arrange for a representation of the exhibitors in Madison Square Garden at a large electrical exhibition to be held at the State Fair at Syracuse, where there are buildings suitable for the holding of an electrical show. The generating plant in the basement of the Garden, the system of arc and incandescent lighting and many other things of the exhibition were carefully examined by the committee.

The Diffusion of Light.

It is very interesting to review the development of artificial-light producers, from the torch to the electric lamp. This development accurately marks the progress of the human race; and no one can predict how much nearer we shall approach to the ideal of artificial light—the light of the sun without the heat of the sun. The subject has attracted the attention of many lecturers and writers, among them the author of the clever verses printed below. The writer, Mr. A. A. Atkinson, is the contracting agent of the Toledo Consolidated Electric company, and he naturally glorifies the incandescent lamp. The poem, attractively illustrated, is distributed as a souvenir booklet by Mr. Atkinson's company.

THE EVOLUTION OF LIGHT.

When man dwelt in darksome forests,
Vast and lone,
And the simple, rude log cabin
Was his home;
As he sat by winter firelight's
Flickering ray,
He ne'er dreamed that in the future,
Far away,
Man would learn to turn the midnight
Into day.

But the world's in evolution,
We all know,
While the years in ceaseless cycles
Come and go;
So the need for light grew stronger,
Bit by bit;
Then evolved that rude creation,
Tallow dip,
For the want of man is mother
To his wit.

Soon another step was added,
Slow but sure,
For with time naught but perfection
Will endure;
So from out this first rude issue
Of man's power
Sprung the stately tallow candle's
Graceful tower,
As in turn from out the rosebud
Comes the flower.

But the queen, the little candle,
Fairy sprite,
Was not allotted long to rule the
Realms of night;
For from depths of old earth's bosom,
Long unseen,
Rose a king, the fiery monarch,
Kerosene,
And he ruled the night by lamplight's
Glow serene.

Yet he found a mighty rival
To his throne,
For now Gaslight claimed the kingdom
For his own;
But man found them each so royal
In their place,
That he crowned them both his sovereigns.
High in grace,
And to-day we see them shining,
Face to face.

But in rush of onward progress,
Very soon,
Man declared he wished the midnight
Like the noon;
And he said "Go chain the lightning
For my home!"
And behold! ere ceased his accents'
Fading tone
Flashed the dazzling Arc Electric's
Upturned dome.

But the climax of the wonders
Of the age,
Far surpassing wildest dreams of
Wisest sage,
Fairest rival of the sunshine
In its might,
Or a thousand stars of Heaven
Gorgeous, bright,
Is the mystic Incandescent's
Globe of light.

Illinois Street Railway Association.

The Illinois Street Railway association will meet in this city on June 7th and 8th. The headquarters of the organization during the convention will be at the Great Northern Hotel. The programme includes several important papers. C. L. Bonney of Chicago will read one on the "Rights of Street Railways under the Constitution." E. X. Lessenr of Danville will discuss the "Operation of Street Railways in Small Cities." W. L. Ferguson of Decatur has been assigned the subject of "A System of Collection of Fares and Checking Employes." D. B. Sherwood of Elgin will consider the "Relations of Street Railways and Municipal Corporations."

C. K. Minary, the secretary of the organization, has issued invitations urging all street-railway men of the state to attend the meeting.

Chicago Edison Company's Storage-battery Plant.

The latest feature of the central-station distribution system of the Chicago Edison company is the storage-battery plant at the Edison building, 139 Adams street, which was the site of the original generating plant of the company. This important addition to the company's equipment is interesting because of the magnitude of the installation, the particular service it is intended to give, the relative part it will play in the combination which comprises the system, and its significance as marking another distinct step in the development of the central-station service of Chicago.

It would doubtless be interesting to trace in detail the development of the central-station system of the company from the formation of the original corporation in 1887 to the present time, but for the purpose of this article it is only necessary to mention the principal events in the history of the enterprise in order to explain the expansion of the business to its present proportions and consequently the necessity for modifying the original plans which provided for a simple direct-current, low-tension system of distribution.

As already mentioned, the Adams street building, in which the storage batteries are placed, was the site of the original power plant of the Edison company. It was completed in August, 1888, and the equipment consisted of four engines and eight dynamos with a total capacity of 800 horse power. After several additions had been made it was found that a new power house would be required, so the Harrison street station was erected, the Adams street plant being abandoned in August, 1894, just six years after the first plant was started. The building was remodeled, the ground floor being used for the construction and supply departments, while the upper floors were devoted to the engineering and operating departments and the executive offices. In the basement a sub-station distribution system was installed, the equipment occupying the front part of the building. The storage-battery plant occupies 7,200 square feet of floor space and extends to the north end of the building. The electrical equipment of this distribution station was described and profusely illustrated in the Western Electrician of January 4, 1896. In addition to the natural growth of the business the company had acquired the property of the Chicago Arc Light and Power company in 1895, and established power plant on Wabash avenue and Twenty-seventh street, and North Clark street near Oak street, to supply current for lighting the residence districts in the North and South divisions. It was found convenient to rearrange the system, and a couple of years ago plans were prepared for this purpose. The changes provided for included the substitution of transformer sub-stations for the steam-generating equipment at the North Clark street and Wabash avenue power houses, current being received from the Harrison street power house at 4,300 volts and distributed at 115 to 125 volts. The plans for this important work and the apparatus

FIG. 5. CHICAGO EDISON COMPANY'S STORAGE BATTERY PLANT.—STRENGTHENING SUPPORTS AND BUILDING FOUNDATIONS FOR BATTERY.

employed formed the subject of a comprehensive article in the Western Electrician of January 1, 1898.

While these additions and improvements were being made the company enjoyed phenomenal prosperity in its original field, and the composite ampere curve for the low-tension system, which is presented in Fig. 1, clearly demonstrates this fact. The business growth of the company has been such during the last year, particularly, that the downtown winter maximum load increased from 36,000 amperes in 1896 to 44,000 in 1897, and it is estimated that should the present growth continue the winter maximum of 1898 on the downtown system will be in the neighborhood of 55,000 amperes. In fact a point had been reached where new investment in machinery or battery had to be made. The peak of the load occurs in winter during the period of short days at about 4:45 p. m., and is about 12,000 amperes in height, and the duration varies from 45 minutes to an hour and a quarter.

The conditions for a battery installation from a point of investment were considered favorable. Current was carried from the Harrison street station to the Edison building on Adams street, over a trunk line 3,340 feet in length, and was then distributed. The old Adams street site was therefore selected for a battery installation, as it made a large trunk-line investment unnecessary. Moreover, the center of load of the system had been gradually moving farther away from Adams street, and it was believed that good regulation at time of maximum load in winter, with feeders varying from 800 to 3,000 feet in length, would require either a booster system or a large outlay in copper. The battery solved the problem, as it was designed to discharge on two voltages, 125 volts to accommodate short feeders and 14 ovolts for long feeders; moreover, provision is made for a third end-cell switch, so that still another rate of discharge can be obtained,

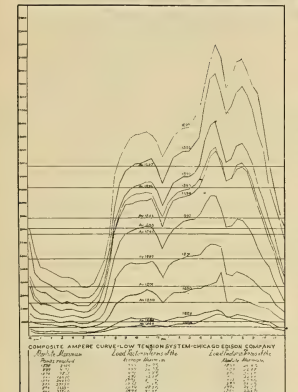


FIG. 1. CHICAGO EDISON COMPANY'S STORAGE BATTERY PLANT.—DIAGRAM SHOWING GROWTH OF BUSINESS.

of the work can be gained from a careful study of these sketches and photographic views.

Before the batteries were set up precautions were taken to determine whether the footings of the columns supporting the floors above would be sufficient to sustain the weight of a duplicate installation. It was found that new footings would be necessary, and the building was temporarily shored up, as shown in Fig. 5. The question of permanency in every detail was the first consideration, as the size of the installation and the limited area and head room made future alterations impracticable.

Some difficult problems were encountered in providing for sub-drainage, surface drainage, supports for the cells, the construction of the floor and protection of the columns and iron beams supporting the upper floors of the building and the ventilation of the battery rooms. A sub-drainage system of three-inch tile pipes laid in concrete was installed, and surface-drainage lead pipes were laid in sand, draining several lead-lined sumpts, both emptying into a large sump at the extreme south end of the room, which is emptied by a lead-lined centrifugal pump and discharged to the sewer.

To prevent settling, five four-inch I-beams were laid crosswise under each cell, and the space between was filled with concrete. Over this a few courses of tarred felt were laid.

The floor is of vitrified shale tiles, 10 inches square

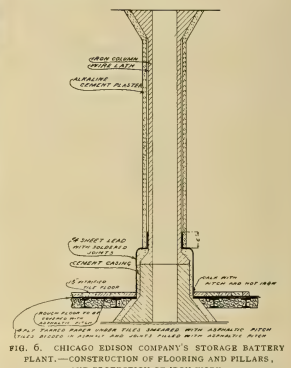

FIG. 6. CHICAGO EDISON COMPANY'S STORAGE BATTERY PLANT.—CONSTRUCTION OF FLOORING AND PILLARS, AND PROTECTION OF IRON WORK.

and two inches thick, laid in a mixture of 70 per cent. of asphalt to 30 per cent. of coal tar. The bottoms of the columns are encased in lead. The columns were carefully cleaned, then treated with a galvanic varnish, and afterward encased in wire lathing, over which a layer of alkaline cement plaster was placed. This was in turn covered with a coating of anti-acid paint. The details of construction of the floor and columns are shown in Fig. 6. All of the walls and ceilings are treated with the same plaster, which rendered them impervious to acid fumes.

Serious objection is often raised to the location of a storage-battery plant in an office building, because of the offensive fumes that arise from the cells. Experts claim that these gases are rather beneficial, but certainly they are not pleasant, and to many they are very objectionable. The subject was carefully considered in this case, and it is believed that the problem of properly ventilating a plant of this character was satisfactorily solved. Two ducts were run on opposite sides the entire length of the room, one for blowing in fresh air, the other for exhausting. A view of one of these pipes is given in Fig. 4. This system affords several cross currents of air, and effectually removes the gases, which are conveyed to the roof and blown to the outer air.

Of course the battery itself is one of the elec-

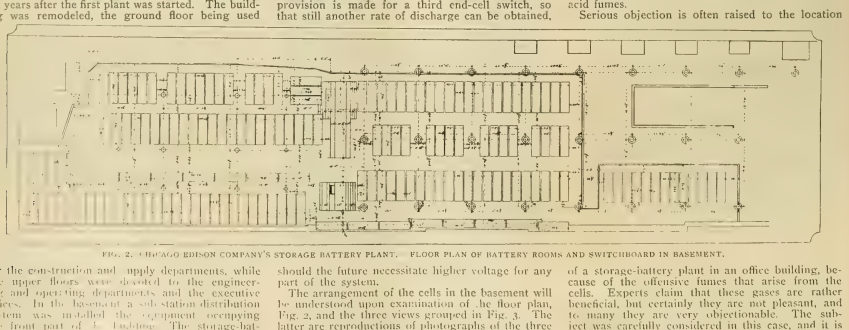

FIG. 2. CHICAGO EDISON COMPANY'S STORAGE BATTERY PLANT. FLOOR PLAN OF BATTERY ROOMS AND SWITCHBOARD IN BASEMENT.

should the future necessitate higher voltage for any part of the system.

The arrangement of the cells in the basement will be understood upon examination of the floor plan, Fig. 2, and the three views grouped in Fig. 3. The latter are reproductions of photographs of the three rooms in which the batteries are set up. They may be designated as room 1, the extreme northerly section of the basement, room 2 the adjoining section on the south of room 1, and room 3, comprising a smaller space still south of the middle section, and occupying only about one third of the width of the building. The relative location of the switchboard is also indicated on the floor plan. An excellent view, looking down the long tier of batteries in room 1, is given in Fig. 4. Some idea of the magnitude

trical wonders of Chicago. To begin with, it is by far the largest battery plant that has ever been installed, and the special use to which it is being put lends additional interest to it. The battery has a capacity of 22,400 ampere-hours at an eight-hour rate, and it is also able to discharge 11,000 amperes for about 1¼ hours. It consists of 166 cells (60 of which are end cells), 83 on each side of the three-wire system. This large number of end cells is required to meet the peculiar conditions, especially the wide variations in pressure. The battery is called upon to deliver 140 volts on each side at the end of discharge, and in case of an emergency to deliver current at a maximum of 120 volts on each side when fully charged. Each

General View of Room No. 2 and End Cell Switches.
General View of Room No. 1, showing Porcelain Supports.

CHICAGO EDISON COMPANY'S STORAGE BATTERY PLANT.

cell contains 87 plates (known as type "H" in the catalogue of the battery company), whose dimensions are 15⅞ by 32 inches. The positives are of the standard Manchester type. Each tank is 21¼ inches wide, 76⅞ inches long, and 43⅝ inches high, and weighs 6,290 pounds. The total weight of the battery, exclusive of conductors, is 1,020,200 pounds. The tanks are constructed of two-inch ash, lined with five-pound lead. They are each supported on 10 double petticoated insulators, resting on tiles laid on the acid-proof floor, as shown in Fig. 3.

The end cell are connected to the end cell switches, as shown in Fig. 7, by lead covered copper bars, six inches wide and one half inch thick, supported by insulators resting on iron girders running between the columns of the building. The main connections of the battery consist of two copper conductors, giving a sectional area of six square inches. The lead coating of the copper is a special feature, which renders the copper impervious to the action of the acid and gases.

There are three end cell switches on each side of the system. These switches have 30 points, and are capable of carrying 2,750 amperes each. The connection between the 30 contacts and the bus-bar of the switch is made by a laminated copper brush traveling on a screw operated by a one-half horse power series motor. These motors are put into operation by push buttons on the controlling switchboard (Figs. 8 and 9), but are stopped automatically when the brush reaches the mid-point on the contact block by an automatic device, which breaks the motor circuit and short-circuits the armature. The method insures the positive action of the end-cell switch without requiring attention of the switchboard operator. These switches are provided with a handwheel for hand operation, if desired. The gear wheels are provided so that the three switches can be geared together and operated as one switch, thus giving a capacity of 8,250 amperes on each side of the system.

The picture, Fig. 8, shows the feeder distribution room of the Adams street station, the storage-battery panel being the addition shown at the right on the end of the regular board. The diagram, Fig. 9 is a reproduction of the plan of the storage-battery panel. This controlling board is connected to the bus-bars of the end-cell switches by 12 cables of 1,500,000 circular mils each. On the controlling board there are three single-pole switches for each end-cell switch, enabling it to be connected to either the mains, auxiliary or charging buses. Each end-cell switch has an indicator on the controlling panel operated mechanically by light shafting and gearing, which shows the operator the exact position of the traveling brush on the end cell switch at all times. On each panel of the board there is a 30-point voltmeter switch, connected to a low-reading voltmeter, which enables the operator to take the voltage of the end-cell switches.

An important feature of this battery installation is the method of charging without the use of boosters, which are ordinarily employed in battery installations. The method designed for the Chicago Edison battery provides for the operation of a pair of 200-kilowatt machines in the Harrison street station at about 180 volts, which is the voltage required for charging and the transmission of the current over the trunk line from Harrison street to the battery station at Adams street. The voltage regulation of the dynamos is affected by an automatic control of the field resistance, which is secured by means of small motors under the control of the operator in the battery station at Adams street. Small lead-covered cables are run from Adams street to Harrison street, connecting with the motors controlling the field boxes. These generators, which are used for charging, were not built specially for the purpose, but are a part of the regular equipment, and at other periods of the day are used to feed into the main bus-bar of the station, thus saving an investment of about $15,000 in boosters, as well as providing a system of charging which is very much more economical than the one in which boosters are employed.

The battery will be kept in circuit throughout the day during the summer months, thus keeping the engines at the central station working at their most economical point, the battery being ready at any time to take care of sudden increases in load, as well as taking care of the peak in winter time, for which purpose it was primarily purchased. By maintaining the battery on the circuit continually, the necessity for regulation of pressure at the central station is very much lessened.

Details of Batteries in Room No. 1.

The batteries were furnished and installed by the Electric Storage Battery company of Philadelphia.

Development of the Central Station.

By Samuel Insull.

Part II.

Passing from a review of central-station plants and distribution systems naturally brings us to the operating cost and the factors governing profit and loss of the enterprise. In considering this branch of the subject, I will confine my remarks to the business as operated in Chicago by the company with which I am connected.

Our actual maximum last winter came on the 20th of December, our load being approximately 12,000 horse power. A comparison of the figures of maximum capacity and maximum load of last winter shows that we had a margin in capacity over output of about 20 per cent. The load curves shown this evening represent the maximum output of last winter (December 20th), an average summer load in a year (June 4th), and an average spring load on the year (May 24). For our purposes we will assume the maximum capacity of the plant and the maximum load of the system to be identical. The maximum load last winter occurred, as I have stated, on December 20th, about 4:30 o'clock in the afternoon, and lasted less than half an hour. It should be borne in mind that the period of maximum load only lasts for from two to three months, and that the investment necessary to take care of that maximum load has to be carried the whole year. It should not be assumed from this statement that the whole plant as an earning factor is in use 25 per cent. of the year. The fact is that, during the period of maximum load, the total plant is in operation

only about 100 hours out of the 8,760 hours of the year; so that you are compelled, in order to get interest on your investment, to earn the interest for the whole of the year in about 1½ per cent. of that period, on about 50 per cent. of your plant.

This statement must bring home to you a realization of the fact that by far the most serious problem of central-station management, and by far the greatest item of cost of your product, is interest on the investment. It may be that the use of storage batteries in connection with large installations will modify this interest charge, but even allowing the highest efficiency and the lowest cost of maintenance ever claimed for a storage-battery installation, the fact of high-interest cost must continue to be the most important factor in calculating profit and loss. This brings home to us the fact that in his efforts to show the greatest possible efficiency of his plant and distribution system, it is quite possible that the station manager may spend so much capital as to eat up many times over in interest charge the saving that he makes in direct operating expenses. It is a common mistake for the so-called expert to demonstrate to you that he has designed for you a plant of the highest possible efficiency, and at the same time for him to lose sight of the fact that he has saddled you with the highest possible amount of interest on account of excessive investment. Operating cost and interest cost should never be separated. One is much a part of the cost of your current as the other. This is particularly illustrated in connection with the use of storage batteries. Those opposed to their use will point out to you that of the energy going into the storage battery only 70 per cent. is available for use on your distribution system. That statement in itself is correct; but in figuring the cost of energy for a class of business for which the storage battery is particularly adapted, the maximum load, that portion of your operating cost affected by the 30 per cent. loss of energy in the battery, forms under 4½ per cent. of your total cost, and it must be self-evident, in that case at least, that the 30 per cent. loss in the storage battery is hardly an appreciable factor in figuring the operating cost of your product. So far as I have been able to ascertain, it would appear to be economical to use storage batteries in connection with central-station systems, the peak of whose load does not exceed from two to 2½ hours.

In order to illustrate the important bearing which interest has on cost, I have prepared graphical representations of the cost of current, including interest under conditions of varying load factors. For the purpose of this chart I have assumed an average cost of current, so far as operating and repairs and renewals and general expense are concerned, extending over a period of a year, although, of course, these items are more or less affected by the character of the load factor. For the purpose of figuring use of your investment being as low as the equivalent of 75 or 100 hours a year. Take another class of business, that of the haberdasher or small fancy-goods store. As a rule, these stores are comparatively small, with facilities for getting a large amount of natural light and little use for artificial light. The load factor, as shown by the chart, is about seven per cent., the use of your investment being not quite twice as long as that of the office building. Day saloons show an average of 16 per cent. load factor;

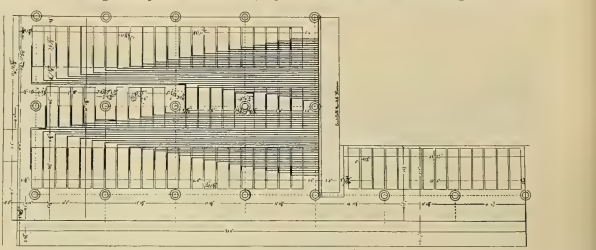

FIG. 7. CHICAGO EDISON COMPANY'S STORAGE BATTERY PLANT.—PLAN OF BATTERY ROOM NO. 2, SHOWING END CELLS IN POSITION AND CONNECTIONS.

cafetiers and small lunch counters about 20 per cent., while the large dry-goods stores, in which there is comparatively little light, have a load factor of 25 per cent., and use your investment seven times as long per year as the office building. Power business naturally shows a still better load factor, say 35 per cent., and the all-night restaurant has a load factor of 48 per cent.

You will see from this that the great desideratum of the central-station system is, from the investors' point of view, the necessity of getting customers for your product whose business is of such a character as to call for a low maximum and long average use. This question of load factor is by all means the most important one in central-station economy. If your maximum is very high and your average consumption very low, heavy interest charges will necessarily follow. The nearer you can bring your average to your maximum load the closer you approximate to the most economical conditions of production, and the lower you can afford to sell your current. Take, for instance, the summer and winter curves of the Chicago Edison company. The curve of December 20, 1897, shows a load factor of

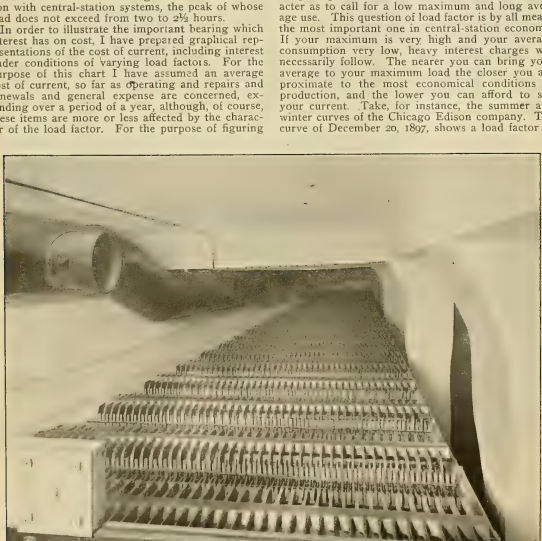

FIG. 4. CHICAGO EDISON COMPANY'S STORAGE BATTERY PLANT.—TIER OF CELLS; VENTILATING SYSTEM.

interest, I have selected seven different classes of business commonly taken by electric-light and power companies in any large city. Take, for instance, an office building. It has a load factor of about 3.7 per cent.; that is, the average load for the whole year is 3.7 per cent. of the maximum demand on you for current at any one time during that period; or, to put it another way, this load factor of 3.7 per cent. would show that your investment is in use the equivalent of a little over 323 hours a year on this class of business. This is by no means an extreme case. You can find in almost every large city customers whose load factors are not nearly as favorable to the operating company, their about 48 per cent.; the curve of May 2, 1898, shows a load factor of nearly 60 per cent. Now, if we were able in Chicago to get business of such a character as would give us a curve of the same characteristics in December as the curve we get in May; or, in other words, if we could improve our load factor, our interest cost would be reduced, an effect would be produced upon the other items going to make up the cost of current, and we probably could make more money out of our customers at a lower price per unit than we get from them now.

Many schemes are employed for improving the load factor, or, in other words, to encourage a long use of central-station product. Some companies adopt a plan of allowing certain stated discounts, providing the income per month of each lamp connected exceeds a given sum. The objection to this is that it limits the number of lamps connected. Other companies have what is known as the two-rate scheme, charging one rate for electricity used during certain hours of the day and a lower rate for electricity used during the balance of the day, using a meter with two dials for this purpose. Other companies use an instrument which registers the maximum demand for the month, and the excess over the equivalent of a certain specified number of hours monthly in use of the maximum demand is sold at greatly reduced price. The last scheme would seem particularly equitable, as it results in what is practically an automatic scale of discounts based on the average load factor of the customers. It does not seem to be just that a man who only uses your investment, say, 100 hours a year, should be able to buy your product at precisely the same price as the man who uses your investment, say, 3,000 hours a year, when the amount of money invested to take care of either customer is precisely the same. Surely the customer who uses the product on an average 30 times longer than the customer using it for only 100 hours is entitled to a much lower unit rate, in view of the fact that the expense for interest to the company is in one case but a fraction per unit of output of what it is in the other. This fact is illustrated by the interest columns on the graphic chart already referred to. Supposing that the central-station manager desired to sell his product at cost, that is, an amount sufficient to cover his operating, repairs and renewals, general expense and interest and depreciation, he would have to obtain from the customer having the poorest load factor, as shown on the load chart, over four times as much per unit of electricity as it would be necessary for him to collect from the customer having the largest load factor. No one would think of going to a bank to borrow money and expect to pay precisely the same total interest whether he required the money for one month or for 12; and for the same reason it seems an absurdity to sell electricity to the customer who uses it but a comparatively few hours a days a year, when it is remembered that interest is the largest factor in cost, and the total amount of interest is the same with the customer using it but a few hours a year as it is with the customer using it practically all the year around.

I have dwelt thus at length on the question of interest cost in operating a central-station system, not alone for the purpose of pointing out to you its importance in connection with an electrical distribution system, but also to impress upon you its importance as a factor in cost, in fact, the most important factor in cost in any public-service business which you may enter after leaving this institution. Most of the businesses presenting the greatest possibilities from the point of view of an engineering career are those requiring very large investment and having a comparatively small turn-over or yearly income. Of necessity, in all enterprises of this character, the main factor of cost is interest, and if you intend following engineering as a profession, my advice to you would be to learn first the value of money, or, to put it another way, to learn the cost of money.

Before leaving this question of interest and its effect upon cost, I would draw your attention to the fact that while interest is by far the most important factor of cost, it is a constantly reducing amount per unit of maximum output in practically every central-station system. When a system is first installed, it is the rule to make large enough investment in real estate and buildings to take care of many times the output obtained in the first year or so of operation. As a rule the generating plant from the boilers to the switchboard is designed with only sufficient surplus to last a year or so. In the case of the distributing system the same course is followed as in the case of real estate and buildings, with a view to minimizing the ultimate investment. Mains are laid along each block facing; feeders are put in having a capacity far beyond the necessity of the moment; consequently interest cost is very high when a plant first starts, except as I have stated, in the case of the machinery forming the generating plant itself. As the business increases from year to year the item of interest per unit of maximum output consequently will constantly decrease, owing to the fact that each additional unit

of output following an increase of connected load increases the divisor by which the total interest is divided. The result is from year to year the interest cost of each additional unit of maximum output is a constantly reducing amount, and consequently the average interest cost of each unit of maximum

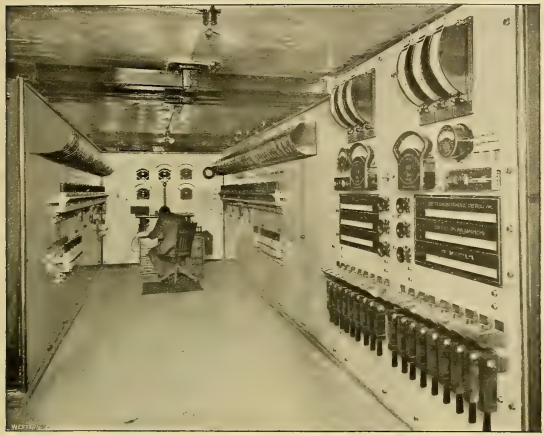

FIG. 8. CHICAGO EDISON COMPANY'S STORAGE BATTERY PLANT.—FEEDER DISTRIBUTION ROOM AND STORAGE BATTERY CONTROLLING-BOARD.

output should, in a well-regulated plant, grow less from year to year until the minimum interest cost per unit is reached. This minimum interest cost is reached when the capacity of the whole system and the total units of output at maximum load are identical, although, of course, it will always be necessary to have a certain margin of capacity over possible output, as a factor of safety.

This same rule, although to a less extent, applies to the operating and general expense cost, that is, the cost other than interest. To particularize, the manager's salary and other administrative expenses do not increase in proportion to maximum output of station; therefore the cost of administration per unit of output, if the business is in a healthy condition, must be from year to year reduced. There are a great many other expenses that are not directly in proportion to output, and these follow the same rule. In a well-run plant the percentage of operating expenses to gross receipts will stand even year after year, while the income per unit of output will be constantly reduced. This is an excellent evidence of the fact that the cost per unit of output is constantly being reduced, as, if it were not, the percentage of expenses to gross receipts would be increased in direct proportion to the reduction in price.

Moreover, it should be borne in mind that there are many difficulties in the way of universal use of electric energy from a central-station system. It is the rare exception to find a house not piped for gas and water. In the case of the latter it is almost invariably the rule that owners are compelled to pipe for water, under the sanary code of the municipality. On the other hand, in a large residential district, it is the exception to find a house wired for electric light; consequently the output of current per foot of conductor is at the present time very low as compared with the output of gas per foot of gas-pipe in any of the large cities. The expense of wiring (which must of necessity be borne by the householder) is large, and it is often a barrier to the adoption of electric illumination, but, as the rule to wire houses becomes more general, the output per foot of main will constantly increase, and therefore the interest per unit of output per foot of main will constantly decrease. This same rule will apply in the case of expenses of taking care of and repairing the distribution system, although to not so great an extent.

If you will take into account these various factors constantly operating toward a reduction of operating and general expense cost and interest cost, the conclusion must necessarily be forced upon you that the price at which current can be sold at a profit to-day is in no sense a measure of the income per unit which it will be necessary for central-station managers to obtain in the future. In 1881-82 it was difficult to make both ends meet with an income of 25 cents per kilowatt-hour; to-day there are many stations showing a substantial return on their investment whose average income does not exceed seven cents per kilowatt-hour, showing 70 per cent. reduction in price in less than two decades. How far this constant reduction in cost, followed by a constant reduction in selling price, will go, it is difficult to determine; but if so much has been accomplished during the first 20 years of the existence of the industry, is it too much to predict that in a far less time than the succeeding 20 years electric current for all purposes will be within the reach of the smallest householder and the poorest citizen?

But few industries can parallel the record already obtained. If you will trace the history of the introduction of gas as an illuminant you will find that it took a much longer time to establish it on a commercial basis than it has taken to establish most

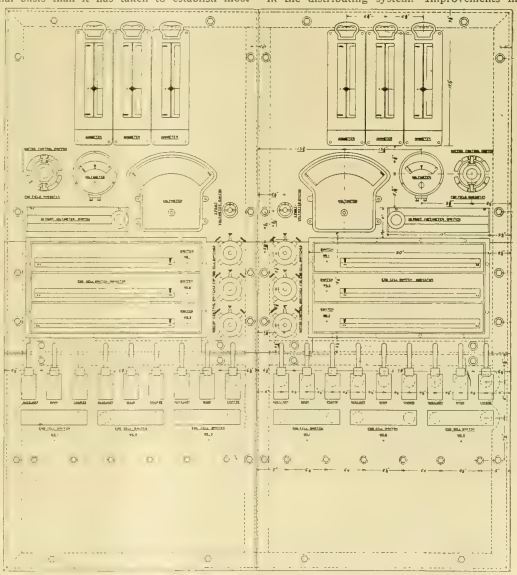

FIG. 9. CHICAGO EDISON COMPANY'S STORAGE BATTERY PLANT.—STORAGE BATTERY SWITCHBOARD PANEL.

firmly the electric-lighting industry. All the great improvements in gas, the introduction of water gas, the economizing in consumption by the use of the Welsbach burner, have all been made within the time of those before me, and yet, notwithstanding that when these gas improvements started the electric-lighting business was hardly conceived, and certainly had not advanced to a point where you could claim that it had passed the experimental stage, notwithstanding this, the cost of electrical energy has decreased so rapidly that to-day there are many large central-station plants making handsome returns on their investments at a far lower average income per unit of light than the income obtained by the gas company in the same community. In making my calculations which have led me to this conclusion, I have assumed that 10,000 watts are equal to 1,500 feet of gas. This comparison holds good, providing an incandescent lamp of high economy is used as against the ordinary gas-burner. To make a comparison between electric illumination and incandescent gas-burners, such as the Welsbach burner, you must figure on the use of an arc lamp, in the electric circuit instead of an incandescent lamp, which is certainly fair when it is remembered that incandescent gas-burners are, as a rule, used in places where arc lamps should be used if electric illumination is employed.

With such brilliant results obtained in the past, the prospects of the central-station industry are certainly most dazzling. While the growth of the business has been phenomenal, more especially since 1890, I think it can be conservatively stated that we have scarcely entered upon the threshold of the development which may be expected in the future. In very few cities in the United States can you find that electric illumination exceeds more than 20 per cent. of the total artificial illumination for which the citizens pay. If this be the state of affairs in connection with the use of electricity for illuminating purposes, and if you will bear in mind the many other purposes to which electricity can be adapted throughout a city and supplied to customers in small quantities, you may get some faint conception of the possible consumption of electrical energy in the not far distant future. Methods of producing it may change, but these methods cannot possibly go into use unless their adoption is justified by saving in the cost of production, a saving which must be sufficient to show a profit above the interest and depreciation on the new plant employed. It is within the realms of possibility that the present form of generating station may be entirely dispensed with. It has already been demonstrated experimentally that electrical energy may be produced direct from the coal itself without the intervention of the boiler, engine and dynamo machine. Whether this can be done commercially remains to be proved. Whatever changes may take place in generating methods, I should, were I not engaged in a business which affords so many remarkable surprises, be inclined to question the possibility of any further material change in the distributing system. Improvements in the translating devices, such as lamps, may add enormously to the capacity of the distributing system per unit of light; but it does seem to me that the system itself, as originally conceived, is to a large extent a permanency. Should any great improvements take place in the medium employed for turning electrical energy into light, the possible effect on cost, and consequently selling price, would be enormous

To the members of the National Electric Light association and the Northwestern Electrical association the Western Electrician extends a cordial greeting and hearty welcome to Chicago.

The arrangements for the convention of the National association in this city next week provide for a series of interesting meetings at which papers upon live topics by experts of recognized ability in the profession will be read. In addition there will be afforded ample opportunity for visiting the big lighting and power plants of the city and inspecting every feature of interest to central-station men and engineers. The social features include a reception on Monday evening that should prove thoroughly enjoyable, and other entertainments on succeeding days, as outlined elsewhere in this issue. The Chicago meeting is intended to be a businesslike affair, in keeping with the importance of the industry.

The Northwestern association will hold its summer convention immediately after the adjournment of the National association, and it is anticipated that many members of both organizations will attend both meetings. The members of the Northwestern association have adopted a novel plan for their convention which should prove attractive. The plan is for the members to assemble in Chicago and embark for Duluth upon the steamer Northwest on June 10th, holding meetings en route. This arrangement has been highly commended, and it is believed many distinguished electrical men will take advantage of the opportunity to enjoy an outing with old business friends.

The Western Electrician, on behalf of the electrical fraternity throughout the West, bids the visitors welcome, and assures them that Chicago appreciates the honor conferred upon it by their presence.

The exhibition at Omaha possesses many features of interest to electrical men, particularly those engaged in long-distance power transmission. Special attention has been given this feature, and complete equipments for this class of work are shown in operation. The opening exercises this week found the grounds and buildings in a fair state of readiness. The electricity department is expected to prove one of the most attractive features of the exhibition.

It is of vital importance to the independent telephone movement that united action be taken in all matters affecting the industry, and for this reason alone everything that tends to promote friendly intercourse should be encouraged. The telephone-exchange managers of this state have formed the Illinois Telephone association, and they will hold a meeting at Mattoon next week. They have already enlisted the support of a large number of independent companies, and are hopeful of increasing the membership and adding to the influence of the organization at the same time. This movement should be encouraged by the industry generally, especially as this is one of the most promising fields in the country.

Mr. Clausen's article on "Operating Telephone and Electric-lighting Systems in Conjunction" is an interesting contribution, and cannot fail to attract attention among central-station managers in the smaller towns of the Northwest, particularly where telephone service is so greatly needed. There is no serious objection to such an arrangement, and there are many reasons why it should prove advantageous. Mr. Clausen offers some valuable suggestions upon the construction, operation and management of telephone systems of this character. The plan has already been given a trial in a few cases with marked success, and it is probable that it will prove popular elsewhere. It is worthy of consideration on the part of telephone and electric-lighting interests.

Considerable disappointment has been manifested because of Judge Seaman's failure to pass upon the right of the City Council of Milwaukee to regulate the rate of fare for street-railway service in the litigation over the four-cent fare ordinance enacted a year ago in that city. In his decision Judge Seaman assumed, for the purpose in hand, that the municipality possessed the power to reduce rates of fare where excessive, and then decided the Milwaukee ordinance invalid on the ground that the rates fixed were unreasonable and did not allow the company a fair profit on the money invested. Judge Seaman calculated, from the expert testimony presented, that a fair value of the property of the company, "based solely on the cost of reproduction," would be at least $5,000,000, and the return upon the investment, on the most liberal estimate, would be only 7.2 per cent., while, according to the claims of the company, the percentage of profit was even smaller. The case may go to the Supreme Court of the United States.

The time for commencement exercises is at hand, and in the next few weeks the army of titled graduates of educational institutions throughout the country will be increased by many thousands of recruits. The ranks of the engineering profession will no doubt receive their share of the new comers, and it is not improbable that there will be many brilliant and accomplished experts introduced to the commercial world, but there will be many more turned loose who desire to embark on a professional career, although they have no especial aptitude for anything save avoiding manual labor. These young men need to be impressed with the dignity of labor. They should be taught that a man may occupy an humble position in life and yet serve a better purpose, if he be content to do his allotted task well, than one who attempts that which is beyond his capacity and goes through life a failure in everything. It is a mistaken notion, too, that honors and wealth are easily acquired in the learned professions. Rarely, indeed, is distinction attained or fortune accumulated excepting through untiring industry and constant application. Genius is seldom rewarded in gold.

Interest in the Philippines naturally stimulates a desire for direct telegraphic communication with Asia, and emphasizes the necessity for laying the Pacific cable. Immediate action is urged by Congress on this subject. The Sun says: "Direct telegraphic communication with Manila by way of Honolulu should be provided as soon as possible by the Congress of the United States. When the war is over the Honolulu and Manila cable will become the instrument of political administration, and, later, of a peaceful commerce, vast beyond the imaginings of enthusiasm and profitable beyond the dreams of avarice. Then, if the government wants to sell, there will be no lack of purchasers."

We do not anticipate that there will be an immediate return upon the capital required for establishing the Pacific cable, but it is quite probable that the enterprise will prove profitable eventually. However, this consideration should not influence the government one way or the other. Just now the cable is a necessity of war, while later it will doubtless prove an effective agent in promoting American trade abroad. The Chicago Record says: "If the United States is to have permanent interests in Asiatic waters it certainly should have cable connection of its own with them, and not be obliged to depend for intelligence upon lines running through the ports of many other countries. But even if the United States should not hold the Philippines, as it is to be hoped it may see its way clear not to do, a cable line to the Asiatic coast would, nevertheless, be of much importance. Trade, to a considerable extent, follows lines of communication, and a Pacific cable would do much to develop better commercial relations with the peoples of the Orient. In many ways it would be an advantage to the United States to have a direct means of speedy communication with those peoples, instead of being compelled to use European cables. The laying of such a cable would in itself be an act tending to stimulate closer relations between the peoples of the two shores of the Pacific. The construction of a Pacific cable, too, would be an accomplishment of civilization of which the United States would have cause to be proud."

This is a common-sense view of the situation, and the experience of other cable enterprises warrants the conclusions reached. Our commercial relations with Mexico and Central and South American countries did not warrant the establishment of cable lines, but trade soon developed, once communication was established, and these enterprises are now profitable investments.

NORTHWESTERN ELECTRICAL ASSOCIATION.

The novelty of the plan proposed by the Northwestern Electrical association for its summer convention has attracted much attention to the project. It is proposed to hold the meeting on the steamer Northwest while making a trip between Chicago and Duluth.

Heretofore it has been customary to hold the summer meetings of this organization at some convenient resort particularly attractive in hot weather, and many of the members have taken advantage of these events to combine their annual outing with

NORTHWESTERN ELECTRICAL ASSOCIATION.—STEAMER NORTHWEST CHARTERED FOR THE EXCURSION CONVENTION.

the convention. This fact, together with the expectation of a large attendance of central-station men at the national meeting in Chicago, led the Northwestern association to consider the advisability of undertaking a more ambitious scheme than had hitherto been attempted. The steamer Northwest was accordingly engaged for the trip, and the citizens of Duluth and West Superior extended invitations to the organization to visit those cities. Other cities along the route took similar action, and the association adopted the plan.

It is proposed to leave Chicago at noon, on June 10th, the day following the closing of the convention of the National association. The party will arrive at Milwaukee the same evening, and the trip to Mackinac will occupy the night. An opportunity to enjoy the sights at this point will be given, as the boat will stop from 7 a. m. until 10:30. This will make it possible to reach Sault Ste. Marie at 5 p. m., which is the most delightful hour of the day for entering the locks. The first of these gates to meet the traveler's eye is that presented in the picture on page 330. The structure at the right is the new government house, and the top of the old citizens of Houghton and Hancock will take charge of the party and show the visitors the famous Calumet and Hecla mines. At 2 p. m. they will return to the steamer and start for Duluth, which they will reach the same evening. A view of the city from the steamer is presented in the picture on this page. A reception will be tendered the association by the citizens, and every opportunity afforded the visitors to view the many industries of the town. On Wednesday a special train will carry the party to Minneapolis, where the power system of the falls of St. Anthony will be examined. A dinner will be given at the West Hotel. This will practically close the affair, and the party will return to Chicago, arriving in this city on Thursday morning. The accompanying map shows the route to be followed, and indicates the points at which stops will be made.

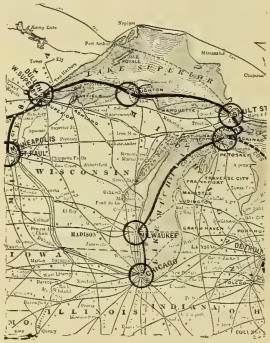
The trip between Chicago and Duluth will doubtless be a very enjoyable one, providing the weather is fine, as it is unquestionably one of the most attractive the country affords. The steamer Northwest has been described as a floating palace, and those who have enjoyed the luxury of that magnificent vessel agree that the title is appropriate. Of the trip itself, the beautiful scenery and the points of interest along the route, much has been written, but probably nothing more entertaining and appropriate than Jeannette L. Gilder' description in the Chicago Tribune:

"On the voyage west we reached the Soo, with its wonderful locks, at about eight o'clock in the evening. We were then 18 feet below Lake Superior, but gradually we lifted until we reached its level and glided gently out upon its cold, deep waters. It made me shudder to think that there were a thousand feet of water underneath us, though we could drown just as surely in less than half of that. It interested me to see how easily our captain handled his immense ship. We never even grazed the sides of the lock, and on the lakes we passed other ships so near that we could have exchanged cards had we been so inclined. As it was, we exchanged foghorn salutes.

"I had often heard of Duluth, but no description of this singular town gave me any idea of its actual peculiarities. As we approached it, the city seemed to rise up and call us blessed. Where were the streets? Not those perpendicular lines, certainly? Yes; there was no doubt about that. From the lake shore to the top of the hill. They stood on end. And the houses—each one appeared to be standing on the shoulders of the one below it to get a peep into the lake! How can people live in them? I should think that they would have to go about with wedges under their feet to keep from tumbling out. I noticed that all the wagons in Duluth were furnished with brakes, and I should think that pedestrians, too, would have brakes on their legs for descending the perpendicular sidewalks. Even walking in the horizontal streets can only be comfortable to those persons who have one leg shorter than the other."

It will be noticed by those familiar with the course of the Northwest that she will not follow the usual line between the Soo and Duluth, which carries her farther north, near Isle Royale. On entering Lake Superior she will lay her course almost directly west after passing Whitefish Point and make a quick run to Portage entry, affording the visitors an opportunity to inspect the Calumet and Hecla copper country about Hancock and Houghton. This will enable them also to pass through the Apostle Islands before entering Duluth.

It is not intended to have a set programme for the convention, although it is believed there will be plenty of interesting and valuable discussions. There will be many prominent electrical men in the party, and it is believed that Mr. Edison, Professor Gray, Mr. Sprague, Professor Thomson, Mr. Wood and Mr. Stanley will accept the invitations of the association. Edward Weston has signified his willingness to assist in making the event successful, and he is expected to deliver an address upon "Electrical Measuring Instruments." A paper on the



NORTHWESTERN ELECTRICAL ASSOCIATION.—MAP SHOWING PROPOSED ROUTE OF STEAMER NORTHWEST WITH CONVENTION PARTY.

"Electrical Smelting of Ores" will be read by W. S. Horry, the electrical engineer who constructed the furnaces for the Union Carbide company at Sault Ste. Marie. Both Edison and Professor Thomson are deeply interested in this subject, and it is anticipated that the informal discussion that will follow the reading of the paper will have much interest. Other topics for discussion have been selected, including "Lightning Arresters," "Transformers," "Meters," "Arc and Incandescent Lamps," "Motors," "Engines," "Furnaces" and "Mechanical Drafts."

Mr. J. M. Hill of Chicago, who has charge of the arrangements for the trip, has been working upon the details of the plan for fully a year. Mr. Hill secured the invitations from the cities of Duluth and West Superior and succeeded in interesting many prominent men of the Northwest in the affair. It was through his personal efforts that the association was induced to consider the proposition.

The steamer will arrive in Chicago on Wednesday or Thursday, and will tie up at Kirk's dock, where she will be open for inspection. Invitations to members of the National Electric Light association and others interested in electrical matters are extended.

A committee of prominent citizens from Duluth and West Superior, representing the municipal governments, chambers of commerce and other public institutions in both cities, will accompany the steamer on its trip from Duluth to Chicago to escort the association back to Duluth.

NORTHWESTERN ELECTRICAL ASSOCIATION.—VIEW OF THE CITY OF DULUTH FROM STEAMER APPROACHING HARBOR.

observation tower in the background can just be seen protruding above the lock. A steamer waiting to come down is also partially shown in the picture. The second view of the Soo discloses a comprehensive scene, embracing the park at this famous resort. Here the visitors will be entertained Saturday evening, and an opportunity will be afforded to attend service on Sunday, as the boat will not leave until noon. The next stop will be at Hancock, which will be reached at 4 a. m. Monday. Here the

Charles Foster of Ames, Ia., has gone to Algona, Ia., to take charge of the electric light plant.

FINDING LIST FOR CONVENTION VISITORS.

The following list of Chicago addresses has been prepared with the hope that it may help out-of-town visitors to the convention to find their way to points of interest, electrical and otherwise. It could, of course, be greatly lengthened, but the idea has been merely to collect in convenient form for reference a few of the addresses that may be sought, by the ladies as well as by the gentlemen.

Armour Institute of Technology, Thirty-third street and Armour avenue. The electrical laboratory is exceptionally well equipped.

Art Institute of Chicago, Michigan avenue, opposite Adams street.

Auditorium Tower, Congress street, near Wabash avenue.

Board of Trade, Jackson street, opposite La Salle street. Aside from its attraction to the general visitor, this building has an interesting isolated plant.

Central Electric company, 264-270 Fifth avenue.

Central Union Telephone company, thirteenth floor of Ashland block, Clark and Randolph streets.

Chicago Edison Railway company, 2020 State street. The company has two large electric power houses—one at Wabash avenue and Fifty-second street and the other at Oakley avenue and Forty-ninth street.

Chicago Edison company, 139 Adams street (offices and sub-station). The generating plants of the company are located as follows:
Main down-town plant, Harrison street and the river.
Series are lighting (old Chicago Arc Light and Power company), Washington and Market streets.
North Side—North Clark street, near Oak street.
South Side—Wabash avenue and Twenty-seventh street.

Chicago Electrical association. Office of the secretary, J. R. Cravath, is at 832 Monadnock building.

Chicago Electric Traction company, Eighty-eighth street and Vincennes avenue. This is the company operating the Englewood and Chicago storage-battery road. The quickest way to visit this interesting plant is to take a Rock Island train station at Van Buren street (or Twelfth avenue) to South Englewood. A longer time is consumed in taking the Alley "L" to Douglas Park avenue station, and there connecting with a storage-battery car, which, of course, will take the visitor to the power house.

Chicago Manual Training School, Michigan avenue and Twelfth street.

Chicago Telephone company's building, Washington and Franklin streets.

City Electrical Department, 14 City Hall. The municipal electric-lighting stations are located as follows:
North Side—Sedgwick street and Chicago avenue.
South Side—Fourteenth street and Indiana avenue.
West Side—Halsted street and Fine Indiana avenue. (In process of erection)—Rice and Lincoln streets.

City Hall, Randolph, Clark, Washington and La Salle streets.

Clubs—
Chicago Athletic Association, 125 Michigan avenue.
Chicago Club, Michigan avenue and Van Buren street.
Columbus Club, 43 Monroe street.
Union League Club, Jackson street and Custom House court.

Commonwealth Electric company, 139 Adams street. The central stations embraced in this company's system are as follows:
Englewood Electric Light company, Sixty-fourth street, near State street.
Hyde Park Electric Light and Power company, 7284 South Chicago avenue.
Hyde Park Thomson-Houston Electric Light company, 37 Fifty-third street.
Mutual Electric Light and Power company, Eighty-ninth and South Ada streets.
People's Electric Light and Motor Power company, Fifty-fifth and Wallace streets.
West Chicago Light and Power company, 1052 West Madison street.
Western Light and Power company, 670 Lincoln avenue.

Douglas Monument, lake shore, foot of Thirty-fifth street.

Electric Appliance company, 242 Madison street.

Ferris Wheel, 1288 North Clark street.

Fort Wayne Electrical corporation, 624 Marquette building, Dearborn and Adams streets.

General Electric company, 1047 Monadnock building, Dearborn and Van Buren streets.

Haymarket Square, West Randolph and Desplaines streets. This was the scene of the anarchist riot of May 4, 1886. It contains the monument commemorating the death of the policemen killed on that occasion.

Hotels—
Auditorium Hotel, Michigan avenue and Congress street. Headquarters of the association. The Auditorium isolated plant is the largest in Chicago.
Grand Pacific Hotel, Clark and Jackson streets.
Great Northern Hotel, Dearborn and Jackson streets.
Palmer House, State and Monroe streets.
Victoria Hotel, Michigan avenue and Van Buren street.
Wellington Hotel, Wabash avenue and Jackson street.

Lake Street Elevated Railroad company, 444 North Clark street. This is practically a part of the "Yerkes system." (See North Chicago Street Railroad company.)

Lewis Institute, West Madison and South Robey streets.

Logan Monument, Lake Front Park, opposite Eldredge place.

Marshall Field's store, State and Washington streets and Wabash avenue; wholesale building, 200 Adams street.

Masonic Temple, State and Randolph streets.

Metropolitan West Side Elevated Railroad company, 200 Franklin street. The trains on this road are pulled by electric motor cars. The power house is at Throop and Van Buren streets.

North Chicago Street Railroad company, 444 North Clark street. This is a part of the "Yerkes system," which is supplied with electrical energy from three large power houses located at California avenue and Roscoe boulevard, Western avenue and Washington boulevard and on Hawthorne avenue between Chicago avenue and Division street.

Parks—
Douglas Park. One entrance is at Ogden and California avenues.
Garfield Park. One entrance is at West Madison street and Central Park avenue. This is a pleasing park. The new electric-light plant is near Hamlin avenue and Kinzie street.
Humboldt Park. One entrance is at California avenue and West Division street.
Jackson Park. One entrance is at Stony Island avenue and Fifty-seventh street. This is the largest park in the city and famous as the site of the World's Fair. It contains the Field Columbian Museum and many other memorials of the World's Fair, shaded lagoons and Rose Garden, etc.
Lincoln Park. One entrance is at North Clark street and North avenue. This is perhaps the most attractive park in the city. It contains the famous Lincoln monument of St. Gaudens, the imposing Grant monument, several other fine pieces of statuary, a menagerie, the electric fountain, the Academy of Sciences, etc.
Washington Park. One entrance is at Cottage Grove avenue and Fifty-first street. This is a large park with fine drives, an extensive common and a conservatory of exceptional size.

Postal Telegraph-cable company, thirteenth floor Stock Exchange building, La Salle and Washington streets.

NORTHWESTERN ELECTRICAL ASSOCIATION.—FIRST LOCK.

Public Library, Wabash avenue, Washington to Randolph streets. This building has an interesting electrical plant and fine fixtures.

Pullman. This interesting manufacturing community is about 14 miles south of the center of the city, on the Illinois Central railroad.

Races (Harlem Race Track), daily at 2:30 p. m. The Lake street "L" trains run to the track.

Roof Garden (Masonic Temple), State and Randolph streets.

Siemens & Halske Electric company, 1215 Monadnock building.

South Side Elevated Railroad company, 47 Congress street. The work of equipping this road for electrical operation is being finished. The new Sprague multiple-unit system is used, each car being an independent motor unit. The power house is at State and Forty-fifth streets.

Sprague Electric company, 1522 Marquette building, Dearborn and Adams streets.

Stanley Electric Manufacturing company, 1506 Marquette building, Dearborn and Adams streets.

Theaters—
Chicago Opera House, 118 Washington street. Continuous vaudeville.
Grand Opera House, 87 Clark street. Weber & Fields' "Lousse Cafe" company.

West Chicago Street Railroad company, 89 West Washington street. This is a part of the "Yerkes system." (See North Chicago Street Railroad company.)

Western Electric company, 242-258 South Jefferson street.

Western Electrician, 510 Marquette building, Dearborn and Adams streets.

Western Society of Engineers, 1737 Monadnock building, Dearborn and Van Buren streets. The society possesses a good technical library.

Western Union building, Clark and Jackson streets and Pacific avenue.

Westinghouse Electric and Manufacturing company, 7 9 New York Life building, La Salle and Monroe streets.

NORTHWESTERN ELECTRICAL ASSOCIATION.—VIEW OF PARK AT SOO.

Great Northern, 81 Jackson street. Henderson's stock company in "Held by the Enemy."
Hooley's, 149 Randolph street. Daly's company in "The Circus Girl."
McVicker's, 75 Madison street. Otis Skinner and company in "Shenandoah."
Schiller, 107 Randolph street. Schiller stock company in comic opera, "Paul Jones."

Union Stock Yards, Thirty-ninth to Forty-seventh streets and Halsted street to Ashland avenue. The main entrance is at Root and Halsted streets.

University of Chicago, Fifty-seventh to Fifty-ninth streets and Ellis to Lexington avenues.

Walker company, 1323 Marquette building, Dearborn and Adams streets.

Electric Railway Litigation.

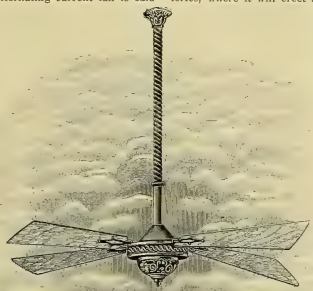
In the case of the General Electric company against the Union Railway company and the Walker company, relating to the infringement of the Sprague motor-suspension patent of 1885 by a method put forth under a similar patent granted to Professor Short 10 years later, Judge Shipman, speaking for the United States Circuit Court of Appeals for the Second Circuit, decides that two of the claims of Sprague's patent were infringed. One paragraph of the judge's opinion is of special interest: "The Sprague invention was not a pioneer and was not of a broad character, but it was a distinct and clearly defined invention in the method of hanging electric motors for vehicles, and its gist consisted in the utilization of the frame of the motor itself with the necessary extension and the centering of the motor on the driven axle by extension pieces from the field magnet at one end, and in its flexible suspension at the other end to the car truck, the armature being carried rigidly by the field magnet." The court limits the infringements to claim 2 and claim 6 of the Sprague patent, however, and the finding of the lower court is modified by removing claim 9, which the Circuit Court held to have been infringed also, from consideration.

The General Electric company considers also that the decision rendered by Judge Townsend in the United States Circuit Court for the District of Connecticut, in the suit brought under the Condict series-parallel controller patent, is of far-reaching importance. This is the decision mentioned in the Western Electrician last week, the title being "Electric Car company of America and Thomson-Houston Electric company against the Hartford and West Hartford Railroad company and others." This statement is made on behalf of the owner of the patent: "Since the introduction of the Condict method of series-parallel control it has superseded all other methods, and it is safe to say that practically every street-car controller to-day employs it. Therefore, the decision of Judge Townsend sustaining the claims relating to this method of control goes far towards placing the practical control of the electric-railway business in the hands of the General Electric and Westinghouse companies, which control the patent."

It is announced that a commission of experts has been appointed in Switzerland to consider the best methods of preventing accidental contacts between overhead electric railway conductors and wires used for telegraphic and telephonic communications. The commission includes Dr. A. Beding, Dr. H. F. Weber, Dr. Hagenbach-Bischoff, Dr. Koepsel and R. Thury.

Bates Alternating-current Ceiling Fan.

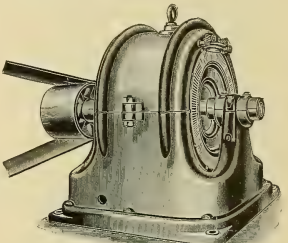
The ceiling fan herewith illustrated is made by D. L. Bates & Bro. of Dayton, O., and the motor is designed to be operated on alternating-current circuits. The fan is self-starting and provided with a switch at the bottom of the basket. The sweep of the blades is five feet two inches and the speed from 180 to 200 revolutions per minute. The motors are wound for any voltage and any frequency, and have self-oiling bearings. The actual power taken by the Bates alternating-current fan is said to be 140 watts. The firm makes this explanation: "Inasmuch as the 'power factor' of the motor is nearly .7 the apparent energy is about 200 watts. Therefore these fans, if connected to current meters, would be charged with much more power than they actually consume, and customers using such meters should make special arrangements with the electric-light company for the current taken by the fans. The above figures refer to fans for high-frequency currents. On circuits of low frequency (7,200 alternations), our fans take about 120 apparent watts and 100 true watts."



BATES ALTERNATING-CURRENT CEILING FAN.

Warren-Medbery Inductor Alternator.

This machine, illustrated herewith, was described in detail in the Western Electrician of May 21st. The cut shows a 150-kilowatt dynamo recently installed in a central station at Ballston Spa. The manufacturer is the Warren-Medbery company of Sandy Hill, N. Y. The efficiency of the machine is said to be equal to the best designs of direct-current generators, and the inherent regulation is claimed to be the best yet attained in alternators of any type. The placing of all the armature coils in a single wreath at one end of the machine and the surrounding of every armature pole with an armature coil are thought to produce better combined efficiency and regulation and a more correct form of current wave than any other construction.



WARREN-MEDBERRY INDUCTOR ALTERNATOR

Heavy Electric Railroading Proposed in France.

An enterprise involving the expenditure of not less than 40,000,000 francs or $8,000,000 and the creation of a road about 2½ miles long, partly underground, to be operated exclusively by electricity, is about to be undertaken in the city of Paris by the Orleans railroad. The main terminal of this railroad, which operates about 4,300 miles of track in the west and southwest of France, is at the Place Valhubert, near the Pont d'Austerlitz and the Jardin des Plantes, in the extreme east of Paris. The traveling population of Paris does not live in the eastern part of the city but in the western, in which direction the city is steadily growing, and access to the present Orleans station in most cases involves carriage transportation. The Orleans company has, therefore, decided to prolong its line into the very heart of Paris, and for this purpose has secured a right-of-way underground to a point on the left bank of the Seine, opposite the Garden of the Tuileries, where it will erect a terminal station. Visitors to Paris, since the year 1872, have had the ruins of the Cour des Comptes pointed out to them as an example of the ferocity of the Commune; it is on this spot that the new Quai d'Orsay station of the Orleans railroad is to be erected. The accompanying outline map of Paris (Fig. 1) shows the proposed extension.

The new road will have two tracks and will drop from the Valhubert station on a grade of 1.1 per cent. towards the Seine. Here the river banks are in two stories, an upper quay or roadway and a lower quay used as a dock or wharf for canal boats. A belt, nine meters wide, has been secured on this lower quay, and the line will follow this in the open for 650 meters. It will be an underground road beneath the upper quay for the remainder of the distance until it reaches the terminus under the Cour des Comptes. Openings in the wall side of the quay facing the river will afford light and ventilation. The rail level is about that of the normal height of the water; any seepage water in times of flood will be gathered in a sump and drained out.

The road follows the line of the Quais St. Bernard de la Tournelle, de Montebello, St. Michel, des Grands Augustins, de Conti, Malaquais and Voltaire to the Quai d'Orsay, passing the Austerlitz Sully, de la Tournelle, de l'Archeveche, an Double St. Michel, Neuf des Arts, du Carrousel, Royal and Solderino bridges. From the Pont Sully to the Petit Pont the underground construction will be a masonry arch, nine meters span, for a length of about 900 meters. From this point, for another 500 meters, the upper roadway will be carried by a metallic arch, and for the balance of the distance the masonry-arch construction will be resumed with a span of about eight meters.

About half way between the Place Valhubert and the Quai d'Orsay, between the Petit Pont and the Pont St. Michel, a station will be built, known as the station du Pont St. Michel. The Quai d'Orsay station—the terminal station—will be between the buildings of the Caisse des Depots et Consignations and the Palais de la Legion d'Honneur and between Pont Royal and the Pont de Solferino. It has been designed by M. Sabouret, chief engineer of the central service. The Orsay station will have 15 tracks, any one of which can be use for arriving or departing trains. According to the present plans, the three tracks nearest the river will be used for side tracks, the next four tracks for the long-distance departing trains, the next two for arriving and departing suburban trains, the next two for arriving long-distance trains, the next two for arriving and departing suburban trains and the last two for station service.

The platforms of the Pont St. Michel station will be 230 meters long. Those of the Quai d'Orsay station 185 to 240 meters long and six to seven meters wide. They are, of course, raised to the height of the footboard of the cars, so that these may be entered directly from the platform. The arriving traffic will come in from the Rue de Bellechasse and the Rue de Lille, and the departing traffic will be concentrated on the Quai d'Orsay. A number of elevators will be installed to facilitate movement of passengers and baggage. The rail level is 25 feet below the street level, and the company has not been obliged to purchase the title to the surface, the structure overhead being carried by a metal roof construction guaranteed by the company. The building above the station will probably be occupied by a large hotel and will, of course, be in harmony with the buildings in its vicinity. The designs of M. Laloux have been selected and approved by the minister of public works.

A short distance west of this station is the terminal station of the Ouest railroad at the Invalides, and still further west is the small station of the Champ de Mars, the former a part of the main line of the Ouest railroad, the latter an off-shoot from the Ceinture or belt line which encircles Paris. These stations will probably eventually be joined to the Quai d'Orsay station of the Orleans road, thus uniting the Ouest, Ceinture and Orleans systems.

In driving the underground tunnel, the Orleans railroad will operate without interference with the street traffic. The earth overhead will be supported by a metal shield pushed forward by hydraulic presses and followed closely by the masonry. The method is similar to that employed in building the great sewer recently laid down in Paris.

The operation of this underground road, as at present contemplated, is to be carried on by means of electric locomotives driven by continuous current at a pressure of between 500 and 700 volts, using the third-rail system of contact. In asking for estimates, however, the company has requested bidders to submit plans also for the use of systems of generation and distribution other than that just mentioned. The locomotives are to be eight in number, all alike, and able to haul a train of 250 French

(Continued on page 351.)

DEVELOPMENT OF THE TELEPHONE FIELD.

Operating Telephone and Electric-lighting Systems in Conjunction.

By H. P. Clausen.

The time is rapidly approaching when managers of electric-lighting, street-railway and other electrical companies owning franchises giving them a right to construct and maintain electric circuits in the smaller cities of the country will take advantage of the rights thus vested in them and operate telephone sysems.

As a rule, electric-lighting companies in towns of less than 20,000 inhabitants find it profitable, though perhaps not always practicable, to shut down their plants during the hours of daylight, thus effecting a very considerable saving in the operating expenses. However, it should be remembered that there is an expensive system of outside construction work lying practically idle, and it is obvious that if it were possible to utilize the polelines for some other purpose than that of carrying the circuits which are in service only during the night, it would represent a marked improvement over the previous practice, and should result in substantial gain in the receipts of the corporation. Practically there are no serious objections to the advisability of operating the two systems under one management. The electric-lighting, street railway or power company's electrician could easily take care of the additional duties imposed upon him, and the company's force of linemen could be utilized to advantage, for the class of construction work that it would be absolutely necessary to maintain would occupy part time.

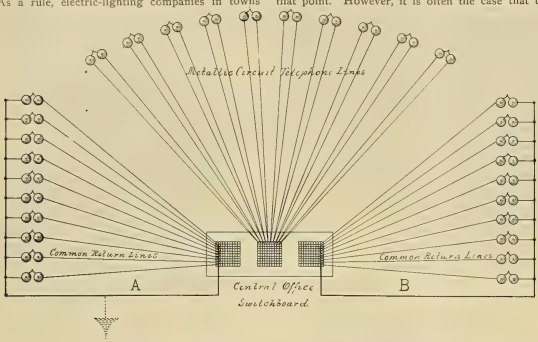

FIG. 1. OPERATING TELEPHONE AND ELECTRIC-LIGHTING SYSTEMS IN CONJUNCTION.

For the purpose of this paper the general details involved, let us say, that it is desired to operate a telephone system in connection with an electric lighting plant already installed. We will say that about 300 subscribers have been obtained, and that it is now necessary to proceed with the construction work required for connecting them to the exchange.

The central-office equipment of a telephone exchange need take up but a small amount of space. The operating room may be less than 12 by 16 feet, and if a storeroom be provided of about the same size, we have all the space that is necessary, as the wires, cables and other line material find a proper place among the same class of supplies belonging in the lighting plant storehouse.

The telephone exchange should be centrally located, of course, but unless the conditions are exceedingly favorable the switchboard should not be placed in the lighting plant, mainly on account of the large number of wires already terminating at that point. However, it is often the case that the lighting station is not advantageously located, and we may disregard the question of placing the telephone switchboard there.

When the central office has been given a fixed location we may consider the proper means for bringing the outside wires into the rooms assigned. The 300 telephones to be connected to the switchboard will require 600 wires, allowing two wires for every telephone. For practical reasons it is not advisable to run so large a number of wires into the exchange; therefore we must establish a convenient number of centers of distribution. Perhaps six or eight blocks away from the exchange a comparatively large number of telephone circuits come in from different directions, say a total of 150 circuits, which means 300 wires. Now, to extend all of these circuits to the central office it would be necessary to build a pole-line capable of carrying 30 10-pin cross arms, which for practical reasons cannot be considered. To avoid this multiplicity of wires at the exchange it is the usual practice to establish a center of distribution, and extend the line connections to the central office by means of aerial cables. It will not be necessary in this paper to discuss the well-known and practically standard principles involved in the construction of telephone systems, but only give attention to the special requirements that are met with when it becomes necessary to utilize pole-lines carrying electric-light wires for supporting telephone circuits.

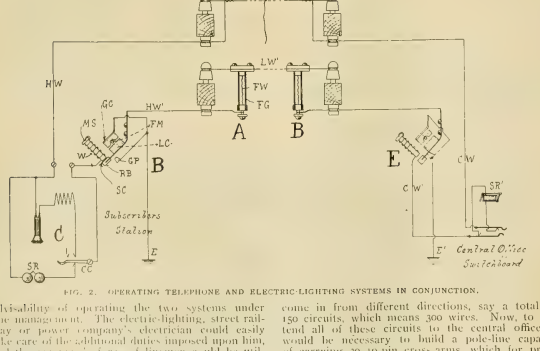

FIG. 2. OPERATING TELEPHONE AND ELECTRIC-LIGHTING SYSTEMS IN CONJUNCTION.

It has already been said that two wires would be required for every telephone circuit, and this is strictly true, where circuits are exposed to the influence of parallel wires carrying currents at more than 250 volts difference of potential. However, in districts where the telephone circuits are not exposed to such disturbing influences, a common wire may be employed, and with good success, providing, of course, a high standard of construction work is maintained. Nor is it advisable to place more than about 15 subscribers on one common return wire, because the least ground on any one of the wires might be the means of producing a disturbing influence on every telephone forming a part of that particular common-wire system. Thus, if we wish to operate 20 telephones on the common-return plan, it would be best to provide a common wire for each set of 10 telephones, and connect each set of common wires to a separate set of metallic circuit lines, as shown in Fig. 1. This plan of construction leaves the return wires entirely separate from each other, and a dead ground on the A system would affect only such telephones as are connected to the A common-return wire, or the metallic-circuit telephones connected to a telephone belonging to the A system.

Apparatus that will be required for protecting the telephone circuits against such extraneous currents as may result from proximity to dangerously charged wires may be divided into two classes, namely, high-tension current protectors and low-tension current protectors. The former class includes all protectors devised to guard against currents having a sufficiently high electromotive force to be dangerous to telephone apparatus. The operation of such protectors depends on the fact that a high-tension current will leap across a comparatively wide air gap, thus allowing it to be employed with good success for severing the telephone circuit.

Low-tension current protectors include all instruments intended to guard a circuit against the passage of a comparatively weak current; that is, a current which may be allowed to flow through a magnet coil for two or three minutes without doing any particular damage; however, after a lapse of four minutes the coil may become heated to a dangerous degree, and if then becomes essential that the telephone circuit be broken, thus allowing the magnet coil to return to its normal condition. This class of protectors generally depends on the opening of a circuit by an auxiliary wire coil, which is more quickly affected by the heating effect of a current than the telephone-magnet coil.

Referring to Fig. 2, the parts of a telephone circuit that require protective apparatus may be seen, P W renresenting a 500-volt street-railway feeder and L W and L W' respectively the unprotected and protected halves of a telephone circuit. As will be observed, the telephone circuit is metallic, whereas the 500-volt circuit serves as a path for currents that employ the earth return. Supposing we have a telephone circuit with both sides unprotected, as shown by L W, and a short piece of "dead wire" falls on L W and P W, it will produce a cross at C and C'. A few practical experiments will soon demonstrate that a cross with highly charged wires should be recorded and rendered harmless immediately. It should be remembered that the telephone circuit is really an extension of the 500-volt feeder, and thus the highly charged circuit can be extended to many other circuits under the central operator's charge. Such crosses should be discovered immediately and rendered harmless. The writer has a personal knowledge of many cases where telephone circuits were crossed with 500-volt feeders, the only evidence being furnished by the discovery of the offending piece of "dead wire." Frequently circumstances proved that the cross had existed for days, and the switchboard operator had unconsciously been dealing out currents, which, under other conditions, might have terminated fatally. How can such danger be overcome? Referring again to Fig. 2, the L W circuit is shown equipped with high-tension current protectors. A represents a simple fuse block with a connecting terminal at each end of a small hollow tube F G. These terminals are connected as shown to the line-wire and the house-wire H W. The line-wire and the house-wire terminals are connected by about four inches of bare copper wire F M, which will fuse open the circuit on the passage of about five amperes of current. At B we have a stationary and normally grounded piece of carbon G C, the line-wire terminal L C, the metal spool M S, around which is wound a quantity of wire W, and the grounded stop G P. As shown, the H W wire connects to the line terminal L C, then through the small piece of metal R B to the metal rod M S and wire W. F M is a small bar of easily heated metal pressed into the carbon block G C by means of a little dab of heated beeswax, which after cooling holds the metal bar in position and out of contact with the carbon block L C. It is understood, of course, that the carbon blocks are separated by a very small air-gap, being easily maintained constant by inserting a piece of perforated mica between the carbons. The space directly opposite the metal bar F M must not, however, be covered with the mica. This device, in combination with the fuse connection A, is placed on both wires and on both extremities of the tele-

phone circuit. In the event of a cross with a grounded or partially grounded circuit having over 250 volts difference of potential, the device is sure to serve its purpose, that is, severing at both ends of the circuit the fusible wire F W.

Supposing we have a properly protected telephone circuit and that a cross is had with P W at C and and C'. As stated before, the carbon blocks G C and L C are separated by a thin piece of perforated mica. In practice the distance is adjusted so that the 500 volts would immediately begin to arc across from carbon to carbon. The arcing quickly generates enough heat to melt the beeswax which holds the metal bar F M, thus allowing the bar to fall by gravity against the line carbon L C. This, when effected, throws a dead ground into the charged telephone wire, and naturally the fuse F W by blowing produces a four-inch air-gap between the line wire L W and the house wire H W. Similar action takes place at the exchange end of the circuit.

Telephone circuits can be protected against the passage of weak currents, say, somewhat over 0.15 ampere, by a device shown at B, Fig. 2. As will be noted, a current coming in over the wire H W passes through the soldered connection S C, to the wire W, and from it to the telephone support C C. The signal receiver S R is thus exposed to the probable damage a current of the requisite strength might produce. The operation of the protective device is as follows: During the passage of a current the wire coil W, which consists of many turns of very fine German silver wire, wound on the metal spool M S, quickly becomes heated, and in turn the metal spool M S becomes warm enough to weaken the soldered contact S C. Now the spring L C normally tends to pull the R B block of metal away from the stationary spool M S, and when the soldered contact S C loses its hold by reason of the heat imparted to it by the wire W and the spool M S, the L C spring succeeds in breaking the S C connecting point and grounds itself on the stop G P. Then, if the current exceeds five amperes, the fuse wire F W at A would open the circuit to earth, as already described.

The following passage is taken from a letter received by the writer in answer to an inquiry regarding the operation of an electric-light plant and telephone system conducted under one management: "I find that it is not good practice to use too many of the poles for electric light and telephone with a common-return system, but I think there will be no difficulty if the metallic system is used. The other work, I find, can be conducted together very economically and to good advantage. As to building pole-lines, I find it quite a help in overcoming the objections of the people, because we can compromise with them and get almost anything we want if we promise to use certain poles for both telephone and lighting systems and therefore reduce the number of poles in the street."

Illinois Telephone Association.

The annual meeting of the Illinois Independent Telephone association will be held at Mattoon on Thursday, June 9th, at 2 p. m., in the city court room.

As this is the second annual meeting of the association, the executive committee desires that no pains be spared to make it interesting. Mattoon is a very central railroad city, and is accessible from all parts of the state. For this reason it is anticipated that a large number of managers of independent-telephone exchanges will be in attendance.

To complete a state organization for any purpose is never a small task, and this is no exception, but the officers are glad to say that they have a membership of nearly one-third of the total number of the companies in the state, and hope to make it two-thirds in a short time, but it will depend largely upon the attendance at the meeting next week.

Some of the telephone manufacturing companies have applied for privileges to make exhibits, and no doubt it will pay operators to see them.

The officers of the association are: President, Dr. J. A. Lumpkin, Mattoon; vice-president, F. A. Brooks, Charleston; secretary, Albert M. Howell, Hillsboro; treasurer, M. Weinberg, Augusta. The executive committee is composed of Dr. J. A. Lumpkin, Mattoon; Albert M. Howell, Hillsboro; B. M. Burk, Carlinville; Miss A. M. McPhearson, Decatur; Dr. W. W. Tobey, Danville.

Automatic Service for Rochester.

Oliver Watson, representing the Automatic Telephone Service company of Buffalo, is endeavoring to secure a franchise from the city of Rochester and form a local company to introduce the system in the Flower City. Several instruments and a "switchboard" have been in operation in the city building for some time to give the city officials and the people an opportunity to investigate the merits of the system. Mr. Watson submitted to the council committee a draft of the franchise that the company desired, which contained the provision that all excavations of the streets and other necessary labor should be done in a manner satisfactory to the city, and that six telephones for the use of city departments would be placed free of cost and without expense for future service. If the franchise was granted the company agreed to put in a system for the accommodation of 5,000 instruments. The franchise provides further that the charges should not exceed $2.50 per month for residences and $3.50 per month for business places. The Bell company's charges are much higher.

Henderson Telephone Company.

The Henderson, N. C., Telephone company, which recently purchased the New Berne exchange, has about completed the installation of the new 200-wire switchboard, telephones, cables, lightning arresters and copper-return wire for that plant. The work has been under the supervision of General Superintendent F. G. Toepleman.

Everything has been so thoroughly overhauled that the system is practically new. The switchboard is one of the finest in the state, and is provided with every modern improvement for quick service. An increase of over 25 per cent. in the number of new subscribers since May 1st shows the public's appreciation of good service. The company is now getting material on the ground, and will at once begin the construction of new exchanges at Littleton, Weldon and Enfield, N. C., and will by fall have all its plants connected by all-metallic long-distance lines.

Solid Metal Receiver.

The accompanying cut illustrates the latest type of receiver imported by the Ericsson Telephone

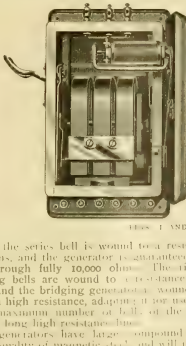
SOLID METAL RECEIVER

company of New York. It is a solid metal shell having the magnet fastened tight, with a rubber-insulated handle which protects it. Climatic changes will not affect the magnet. No adjustment is required, and the action is always positive.

The company's 1898 catalogue, which is now ready for distribution, will be sent out on application. The company manufactures and imports 60 different patterns of instruments.

Bridging and Series Bells.

In the accompanying cuts are shown (Fig. 1) the bridging and (Fig. 2) the series-magneto bells which the Western Telephone Construction company of Chicago is now introducing. The armature are of the softest grades of iron. The armatures are of large size, wound with ample amount of wire necessary to assure proper results. The automatic shunt is positive in action. Its operation requires no pushing of crank, and perfectly breaks the shunt circuit around the generator whenever the crank is turned, and thus assures certainty of operation of clearing-out drop when subscribers on lines connected ring off. Heavy cut gears are provided, which run smoothly and will last a lifetime. The call bells have centrally pivoted ringer armatures; the cores are of best annealed Swedish iron and the permanent magnets of best magnetic steel. The trunnion screws for armatures are provided with locking nuts to prevent working loose, and the armature is so arranged as to prevent its sticking against the pole-pieces. These bells have high coefficient of self-induction, and are very sensitive to influence of magneto current. The generator armature and bell magnets are wound with the best quality of silk-covered wire.



FIGS. 1 AND 2. BRIDGING AND SERIES BELLS

The automatic hook switch is the regular Western type. The springs are all made of finest quality of German silver, are long and flexible. An anti-friction shoe is placed on the lever to prevent any wear between it and the mainspring. Contact points are of platinum.

The bell box is made of selected quartered oak, walnut and cherry, finely polished and finished, with nickel-plated trimmings. It will accommodate a long-distance type of induction coil. The back of bell box is extended above and below the box proper, so that the bell can be screwed on to its support from the outside. Outside binding-posts of substantial design are provided for connection of receiver-cord tips and primary and secondary transmitter circuits. The sides of the box are of heavy material, and the generator is firmly screwed in position.

Lightning arrester plates are arranged so that incoming lines can be grounded on either side of the bell. All connections are soldered, and the slotting and wiring is neat. The magnets are enameled with the best grade of red enamel and have nickeled and polished trimmings.

H. C. Dodge, the general manager of the Western Telephone Construction company, says the new equipment has been highly commended by experts in exchange work and that there is already a considerable demand for the new type.

Telephone Extension in Utah.

A. J. Vance, a Utah telephone man, has been lately investigating the telephone prospects in Sanpete county in that state. He is contemplating the feasibility of building a line from Manti, the county seat, through the various intermediate villages to Nephi, Juab county, 75 miles south of Salt Lake City. At Nephi connection with the long-distance system would be had. If the Rocky Mountain Bell company has discontinued operations in Sanpete county permanently, Mr. Vance says that his company will proceed at once with the construction of the line.

Progress in Minnesota.

The Minnesota Central Telephone company has nearly completed its lines to Minneapolis, and expects to establish toll stations and be ready for business about June 15th. The main line of 55-foot poles is finished in the city, and the company is stringing copper wire as far west as Litchfield, which will give it a metallic circuit from Willmar to Minneapolis. The company is also arranging to string copper wire in other directions from the city, and will be connected with St. Paul about the first of July. It proposes to build a line from Minneapolis to Aberdeen, S. D., too, and when the different lines are completed, it will have, in connection with the other companies comprising the Western Electric Telephone system, what is said to be the most complete independent toll-line system in the Northwest, comprising about 5,000 miles.

The Sunset Telephone company is rebuilding lines out of Pomona, Cal., and will shortly rebuild the system in that city.

WAR NEWS.

Cable-cutting Operations.—In the last issue of the Western Electrician the cable cutting by the auxiliary cruiser St. Louis at Santiago and San Juan was briefly alluded to. On May 28th the St. Louis arrived at her home port—New York—and Captain Randle, the navigating officer, gave further details of the cable-cutting attempts in which the ship had participated. According to the newspaper account of the captain's story, the St. Louis left St. Thomas on May 13th, scouting along the north coast of Porto Rico and stopping a few miles east of San Juan to grapple for the cable connecting that place and St. Thomas. This cable was successfully caught and parted. On the 16th the St. Louis and the government tug Wampatuck made an unsuccessful attempt to cut the cables at Santiago. Two days later another effort was made at the same place, with a greater degree of success. A cable was picked up and about 100 fathoms cut out. This section was retained on the St. Louis and taken to New York. On May 19th the two vessels proceeded to Guantanamo to cut the Haytian cable. This cable was grappled by the men on the little Wampatuck, but a Spanish gunboat caused the tug to retire, although Captain Randle says that he believes that the efficiency of the cable was destroyed. At Santiago there was a sharp exchange of shots, but neither at that place nor at Guantanamo was any American injured, and the damage to the vessels was but trifling. After parting company with the Wampatuck on the 20th, the St. Louis went again to Porto Rico, arriving off Cape Rojo, the southwestern corner of that island, on the 22d. Here an effort was made to grapple with the cable connecting Porto Rico with San Domingo and Jamaica. The captain says that "after nearly a day of patient work we found that the grapplings would not hold in the foul bottom. We believe that we broke this cable, and the absence of information over it tends to confirm our opinion." "How many cables were cut in all?" asked the reporter. "Three," said Captain Randle—"the one north of Porto Rico connecting with San Domingo, the cable at Santiago de Cuba, connecting with Jamaica, and the line at Guantanamo, running to Cape Haytien, Hayti."

However, it is still very doubtful whether the cable connection between Cuba and Kingston, Jamaica, has been cut off. Duplicate cables connect Santiago and Kingston, and both would have to be cut to stop the sending of messages. Again, the cable between Santiago and the island of Hayti, via Guantanamo, was reported to be in working order as late as May 26th. It is suggested as a possibility that some of the cables cut in West Indian waters during the present war were only dummies laid for such deception. This ruse is not new, but it cannot easily be detected. It was worked successfully many times during the last war between Chile and Peru.

The Signal Service.—Captain John R. Bartlett, United States Navy, superintendent of the coast signal service, reports that a complete system of observation is established along the entire Atlantic and Gulf coasts of the United States, and that the coast signal service is thus fully in operation. This is effected through the co-operation of the keepers of all lighthouses, crews of the life-saving stations, observers of the Weather Bureau and connection by telephone and telegraph wires of the several serivces and the Western Union telegraph to the headquarters of the Navy Department at Washington. It is believed that it would be impossible for a Spanish ship or fleet to come within dangerous proximity to the Atlantic or Gulf shore without being reported to Washington as well as to the nearest military or naval depot. A very important adjunct of this service is the patrol by the crews of the life-saving stations along the coast, filling in gaps between lighthouses and coast signal stations. Captain Bartlett has called attention to the fact that under existing laws the crews of life-saving stations will be "laid off" during the most of June and July. The coast signal service would be greatly crippled thereby. The coast signal service is of such importance, that in order to maintain its efficiency Secretary Long earnestly requests that immediate steps be taken to obtain the necessary authority of law to have the crews of the life-saving stations, or half crews, kept on during the war. A special act of Congress, with an extra appropriation making provision for pay of crews, will be necessary.

Miscellaneous Notes.—In the work of mining the harbor of San Diego, Cal., expert volunteer electricians, under command of Lieutenant Meyler, U. S. A., were employed. Each man was required to take the following oath: "I solemnly swear that I will bear true allegiance to the government of the United States of America, and will support the constitution thereof, and that I will not under any circumstances, either directly or indirectly, divulge or impart to any person or persons anything which has, or may hereafter, come to my knowledge relating or appertaining to the torpedo sysitem or submarine mines which are now or may hereafter be placed in the harbor of San Diego, Cal.; nor will I communicate to any person or persons any knowledge or information which I now have, or may hereafter acquire, in reference to the fortifications of said harbor, or the defense thereof. This oath is taken freely and voluntarily, and without any mental reservation or secret evasion whatever, and to the faithful performance of which I pledge my sacred honor, so help me God."

A detachment of regular-army engineers from the battalion having headquarters at Willet's Point, near New York, has arrived in San Francisco to go with the second expedition to Manila. The command consists of 60 men, under Capt. William C. Langfitt, First Lieutenant Charles P. Echols and Second Lieutenant William D. Connor. The detachment took along a complete engineering outfit. This included picks, shovels, spades, transits, levels, a pontoon train of canvas boats and all tools necessary for making and planting submarine mines and torpedos. The material for making the mines, junction boxes, cable and electric batteries will be obtained in San Francisco. Captain Langfitt said he had no notion of what work his command would be expected to do on its arrival in Manila, but his men were ready for any work that army engineers can do.

Mr. Chandler has introduced a bill in the United States Senate authorizing the secretary of the navy to establish and maintain all such telegraphic communication as he may deem necessary during the continuance of the present war by opening or reopening such ocean lines as may be necessary in any exigency for the proper protection of naval and military operations. The bill carries an appropriation of $1,000,000.

Julius Buerstaette of Manitowoc, Wis., has left the electric-light company of that city to accept a position as electrical engineer on one of the United States warships. His patriotism costs him a financial sacrifice, for his salary is only half what he was receiving from the electric-light company.

The New York Sun states that some surprising schemes for winning money or fame have been developed by the war with Spain. The promoters bombard the departments with letters and besiege officials for personal interviews. Several concerns that run electric stereopticon shows have applied for permission to put photographic plants on American ships of war, from Porto Rico to the Philippines. They offer to take chances on having their operators killed in engagements and to waive any claim against the government in case any of them should get maimed or killed. The naval authorities, in their consistent and praiseworthy effort to be courteous and civil to all hands, have endeavored to repulse these concerns by informing them that there isn't room on any of the ships for their plants. But this way of putting it is not satisfactory to the concerns, which reply that their operators are men inured to hardship, can live anywhere aboard ship, and can conduct operations from barges or launches towed by the warships, for the matter of that. Another company of the same sort has been making the army officials wretched since the mobilization of state troops began, with appeals that its operators be permitted to accompany the armies that are to invade Cuba and the Philippines. This company also nobly waives the right to claim indemnity from the government in case any of its operators should get the worst of it while members of the expeditions, and it states, besides, that it stands ready to secure as operators men who are immunes from yellow fever, beri beri, elephantiasis, or any other of the ills that the alarmists ascribe to the tropics. Moreover, the company will generously pay the government for the transportation of the operators and their luggage and apparatus. This company has been informed that its men cannot go as members of the army expeditions.

The following "press item" sent out by the Westinghouse company has an especial interest at this juncture: "Even Spain shares in the general rush for American electrical machinery. The Westinghouse Electric and Manufacturing company, through its London representatives, has installed one of its 135-kilowatt, single-phase, separately excited alternators, belted to a Westinghouse engine, for the Malaga Electricity company of Malaga, Spain. The decay of Spain's power might be traced largely to the absence of engineering ability among her indolent population. She cannot build her own machinery, and in most cases she is unable to operate it when it is built. The ambitious youth of the present day comes to America to study engineering, realizing that the field in his country is by no means overstocked. Meanwhile, American enterprise is installing American systems and American methods in Spain."

Captain J. E. Brady of the Signal Corps is the new press censor at Tampa. He is said to be an expert telegraph operator, a former newspaper man, and able to speak Spanish fluently. Captain Brady insists on strict adherence to the letter and spirit of the government censorship. Among other precautions he is said to have warned railroad telegraphers from discussing military operations over the wire.

A board of officers to consist of Col. George L. Gillespie, Corps of Engineers, and Eugene Griffin of New York, who was recently appointed colonel of the First United States Volunteer Engineers, has been appointed to meet in New York, at the call of the senior member, to examine applicants for commissions in the First Regiment United States Volunteer Engineers. Candidates for commissions will be ordered before the board from time to time by the War Department.

Among those officers of the Chicago naval reserve who have passed the examinations imposed by the navy for officers' places and have been recommended by Commander Hawley for commissions in the navy is Lieut. S. D. Flood, a former well-known electrical man.

F. B. Badt of Chicago has tendered his services to the government in the present war with Spain. His experience in the Prussian army, where he held the rank of first lieutenant, and his knowledge of engineering should prove valuable at this time.

Heavy Electric Railroading Proposed in France.

[*Continued from page 331.*]

tons in seven minutes between the stations of the Quai d'Orsay and the Pont d'Austerlitz without stopping at the intermediate station of the Pont St. Michel. This means a speed of 45 kilometers an hour. The locomotives should not only be able to haul a train of the weight mentioned on a grade of 11 millimeters and on curves of 200 meters radius, but should also be able to haul trains as heavy as 300 tons at a slower speed. The locomotives must be built to move in either direction at the same speed, and be of a length to allow them to be turned on turn-tables six meters 20 centimeters in diameter. They are to be equipped with motor-driven air pump and air brakes.

The electric generating station will be placed at the western end of the Valhubert station departing platform, taking the place of certain waiting rooms. The equipment is to be of sufficient capacity to allow of the simultaneous movement of four 200-ton trains, exclusive of the locomotive, upon the line—one starting from the Austerlitz station, one from the Quai d'Orsay station, the third climbing the grade of 11 millimeters, and the fourth running between the Pont St. Michel and the present main station. Furthermore, the generating plant must include sufficient lighting capacity for three stations already mentioned, and the tunnel, as well as for the station and shops at Ivry. The current is to be taken by the locomotives from an insulated third rail at the side of the track in the stations and between the tracks over the rest of the line, due provision being made for all switches and cross-overs.

In order that a better knowledge of the operation of electricity in heavy traction service might be gained than was possible in Europe, the Orleans company recently sent over to America a corps of engineers to investigate the different electric-railway installations of this type in this country. The party was headed by M. E. Solacroup, assistant chief engineer of material and traction, and M. Sabouret, already mentioned; the other members being Messrs. Riberty, Fremenville and Walton. Their inquiries were conducted very quietly, but during their short stay they were able to visit almost every installation of special interest to them in the United States.

The investigation was begun at Hoboken, where an electric locomotive is hauling all the freight service between the trans-Atlantic docks there and the West Shore and Erie railroads. From there they visited Baltimore to inspect the great electric locomotives which operate the entire traffic of the Baltimore and Ohio railroad through the belt-line tunnel in that city. From Baltimore they went to Chicago for the purpose of observing the operation of the electric elevated railroads, and, returning East, passed through Cleveland, Niagara Falls and Buffalo, where they had an opportunity of studying the employment of the electric car in high-speed interurban service.

From Buffalo they traveled to Boston, where they were met by C. P. Clark, president of the New York, New Haven and Hartford railroad, and Col. N. H. Heft, chief electrician of the same road. They traveled over the Nantasket Beach branch of the New Haven system, between East Weymouth and Hull, and inspected the power house. Returning, they visited the third-rail electric system between Berlin and Hartford, Conn., opened for traffic last summer, and rode on the 30-ton electric locomotive operating between factories at New Haven and the Cedar Hill Junction.

A special test was arranged for their benefit at Schenectady on the experimental two-mile track of the General Electric company, the conditions of the track and load being, as far as possible, similar to those which will obtain on the line in Paris. A length of track 1.11 miles long, corresponding to the distance between the Quai d'Orsay and the Pont St. Michel stations, the most difficult portion of the proposed Orleans extension, was marked off. According to the time schedule arranged for the operation of the road, this distance should be covered in three minutes and 50 seconds. A train was made up of a motor car of the Nantasket Beach pattern equipped with four "G E 55" 175 horse power motors, several New York Central coaches and seven flat cars loaded with pig-iron, making a total trainload of 320 tons, including the motor car, which weighed 45 tons. The run between the marking flags, including starting and stopping, was made easily in three minutes and 25 seconds, giving a margin of not less than 25 seconds.

The question of rendering the third rail innocuous after the passage of the train having been brought up, the General Electric company arranged an ex-

hibition of its method of effecting this result. A section of the third rail was measured off and divided into sections in lengths varying from 30 to 500 feet. Connections were made between these and a system of automatic switches, and the conditions of the General Electric system of surface contact almost exactly reproduced. By this system the arrangement of circuits is such that the sections into which the rail is divided may be of any length from that of a few feet to any number of miles; that is, any section of the conductor rail will be alive only when the train itself is running over that section. The instant the train passes to the succeeding section, that which it has just left becomes dead and absolutely innocuous. The use of this system also renders it possible to "section" the conducting rail at stations, leaving it continuously alive at all intermediate points. The switch cutting the dead section into circuit is closed as the contact-shoe of the train comes into contact with the conductor, energizing it, and is automatically opened as the train passes to the next dead section.

The motor car was run over that part of the track beside which the third rail was sectioned, and, as a visual means of indicating that the third rail was alive, a number of incandescent lamps on the top of the boxes containing the switches were connected to the conductor. As the car reached the sections and rendered them alive, the lamps lighted up, being extinguished as the contact-shoes passed over the dividing lines between the different sections.

These tests formed the subject of the concluding investigations of the French engineers in this country. A few days before their departure a dinner was tendered to them at Delmonico's, at which many prominent railway engineers and electricians were present to meet them. They admitted having received many new ideas during their stay, and return to France convinced of the use and possibilities of electricity as a motive power, especially in the field of heavy traction.

In Fig. 2 is shown a group of engineers, including the visiting Frenchmen. The picture was taken at Schenectady, and the motor car of the test train is shown on the trial track.

Insulation of High Voltages.

A dispatch from Marysville, Cal., to the San Francisco Chronicle, dated May 13th, says: "An experiment concluded here by Dr. F. A. C. Perine of Stanford University for utilizing the electric power line of the Yuba Power company from its power house to Brown's Valley, a distance of 10 miles, has resulted in demonstrating that 36,000 volts may be transmitted over a copper wire using glass insulation, against 16,000, which has been the maximum in practice in power transmission heretofore. The result of the experiment will be to effect a saving of half the cost of wire in the construction of electrical-transmission plants in future. As it is now, the cost of wire is about half the entire cost of a plant. The exact loss in the transmission of this high current has not as yet been made known."

New York Electrical Society.

The annual meeting of the New York Electrical society was held at Madison Square Garden on May 26th. The following-named officers were elected: President, Gano S. Dunn; vice-presidents, Willard S. Case, H. B. Coho, Dr. C. A. Doremus, F. A. Pattison, E. E. Higgins, Charles Blizard; secretary, Geo. H. Guy; treasurer, H. A. Sinclair. The treasurer's report shows that the society is in a prosperous condition. According to the secretary's report, the membership last year was 397; there have been 215 members elected this year; there have been four resignations and one death. There are now 607 members in the society. The number of new members elected at the annual meeting was 37.

Omaha Exposition Open.

The Trans-Mississippi and International Exposition at Omaha was formally opened on June 1st. President McKinley, in Washington, "touched the button" to start the machinery and also sent a congratulatory message which was read by the governor of Nebraska to an audience of 6,000 persons. There was a parade, several addresses, a luncheon for the distinguished guests and felicitations generally. The exposition is on a scale of greater magnitude than many visitors anticipate and is said to make a very favorable impression. It will be open until November 1st.

Anchor Electric Company's Affairs.

A decree for the plaintiff has been ordered by the full bench of the Supreme Court of Massachusetts in the case of the Anchor Electric company of Boston against Horatio C. Hawkes. The plaintiff, in seeking to carry out an agreement made by Mr. Hawkes, asked for an injunction to restrain him from interfering or competing with it in its business for a period of five years from September 29, 1894. Though the agreement was not limited as to territory, and the plaintiff's business extends over the whole country, the court holds that it is a valid agreement, going no further than is reasonably necessary for the protection of its business, and is not void as in restraint of trade.

The agreement was made upon the sale by the defendant of his interest in the Hawkes Electric company and the consolidation of this company with the Iona Manufacturing company and the Brown Electric company, by the formation of the Anchor Electric company. All officers of the old companies signed the agreement, and the court holds that it went no further than was reasonably necessary to protect the good will of the defendant's corporation, and is enforceable against him.

City Telegraph Superintendents.

The third annual convention of the Fire and Police Telegraph Superintendents and Municipal Electricians will be held at Elmira, N. Y., on August 9th and 10th. Members are expected to bring their wives, as special arrangements are being made for their entertainment. Several papers will be read by well-known electricians. W. Y. Ellett is president and H. F. Blackwell secretary of the association.

Four-cent Fare Defeated.

Judge Seaman in the United States Court at Milwaukee on May 31st decided the four-cent fare case of the city of Milwaukee against the Milwaukee Electric Railway and Light company in favor of the street-railway company. The case involved the validity of the ordinance to compel the street-railway company to sell 25 tickets for $1. Judge Seaman pronounced the ordinance illegal. The case will probably be appealed to the United States Supreme Court.

The decision does not touch upon the question of the right of the city to regulate the fares of the street railway company. It simply decides that in the case of the Milwaukee Electric Railway and Light company it could not earn a dividend commensurate with its investment upon a four-cent fare. It also holds that a five-cent fare is not an excessive charge and is just.

CORRESPONDENCE.

New York Notes.

New York, May 31.—A dispatch from Albany states that the Metropolitan Street Railway company and the Third Avenue Railroad company have made application to the railroad commissioners for permission to change their motive power on all their cable lines to that of the conduit system of electrical propulsion. The Metropolitan has also made application to change the motive power on its horse lines to the same system or to compressed-air propulsion. Hearings will be given by the commission on these applications on Thursday at the Fifth Avenue Hotel in this city.

These coincident applications are considered significant of a possible consolidation of all the important surface-railroad interests in New York, or at any rate in the borough of Manhattan. The Metropolitan and Third Avenue companies are now working together harmoniously, whereas until this year the two corporations were at swords' points. In addition, it is said that a working arrangement between the Manhattan Elevated company and the surface roads is a further possibility. It is reported that an attempt was made some months ago by the Metropolitan capitalists to make a deal whereby an exchange of stock or some similar undertaking would enable the two roads to be operated jointly, with a material saving to both. That deal fell through because neither Mr. Gould nor Mr. Sage would listen to anything but a cash transaction. But it is believed that since that time a satisfactory plan of action has been agreed upon. A working agreement with the Brooklyn roads is also hinted at. Altogether, the financial men of the city are looking for important developments in the transportation situation in New York, although the officers of the companies continue to deny that consolidation is under consideration.

At the office of the Metropolitan Street Railway company it is stated that as soon as possible after the hearings by the commission work will be begun toward establishing complete interchangeability on all of its lines. The general motive power is to be that of the underground electrical system, but experiments will be made with the compressed-air system on some of the short crosstown lines. The extent to which air motors will be used will depend on the results of the tests. "We are entirely satisfied with the results of the electric system now in use," said an officer of the company to a reporter. "All of the defects were developed and remedied on the Lenox avenue line, where the system was first tried. The first car run on the Fourth avenue electric line made as good time as the cars now running. The lack of interchangeability, by which is meant the inability to take passengers from one end of the line to the other, or to points east and west, without transferring them, is a serious inconvenience. Our idea is to make a universal and standard line all over the city. Nearly seven hundred and eighty million transfer tickets were given out last year. While this cannot be entirely overcome, we intend to reduce it considerably. The compressed-air method of propulsion has one distinct advantage—cars thus propelled can go anywhere that tracks are laid. The great difficulty which confronts the street railway company is the fact that while our acreage is constantly increasing, the trackage is limited. It is impossible, for example, to lay more tracks on Broadway, but every time an old building is torn down and a sky-scraping office building goes up it adds a large number to the persons who use the line at certain hours every day. By eliminating the slower method of propulsion in use on some of the lines the congestion will be somewhat decreased, but the carrying of 600,000 passengers daily is a subject which continually presents new difficulties."

In the suit of the minority stockholders for a permanent injunction restraining the majority stockholders of the Kings County Traction company from sellng the asests of the company, Justice Barnard of the Supreme Court has granted the motion to contine the injunction pending a trial on the merits of the case. The trial will be had before Justice Maddox in the Special Term of the Supreme Court in Brooklyn.

Three new street-railroad companies have applied to the State Railroad Commission for permission to construct roads in New York. The North End Street Railway company, with a capital of $5,000,000, wants permission to construct a road 13 miles long, with termini at the intersection of Manhattan avenue and One-hundred-and-sixteenth street, and at the intersection of Kingsbridge road and the northerly line of New York city, with numerous branches. The Fort George and Eleventh Avenue Railroad company, with a capital of $10,000, seeks authority to construct a road 1,500 feet long on Eleventh avenue, between Kingsbridge road and One-hundred-and-seventy-fifth street. These two roads are backed by the Metropolitan Street Railway company. The Kingsbridge Railway company, with a capital of $1,000,000, desires permission to construct a road about eight miles long from the intersection of Manhattan street and the boulevard running along the latter thoroughfare to Kingsbridge road, and from the junction of Amsterdam avenue and Kingsbridge road, connecting with the existing road, or Amsterdam avenue, at One-hundred-and-sixty-second street, thence along Kingsbridge road to and upon the Harlem ship-canal bridge, and over the proposed bridge across Spuyten Duyvil Creek to the northernmost point of intersection of West Two-hundred-and-thirtieth street with the Kingsbridge road, thence along Two-hundred-and-thirtieth street to and along Riverdale avenue to the city line. This road is to be a connection of the Third avenue line.

Attention is directed to a decision of the Court of Appeals, rendered on May 10th, which will bring about an extraordinary change in the law of this state relating to the obligations of railroad companies to their passengers, unless the court upon a reconsideration of the questions involved abandons the rule laid down on that occasion. Xavier Stierle sued to recover damages from the Union Railway company of this city for personal injuries suffered by him while a passenger on one of the defendant's street cars. The plaintiff alleged that he had been thrown from the car because it was "suddenly, negligently and carelessly driven around a curve in the track upon which it was being moved over a switch." There was conflicting proof as to whether the accident really occurred through the negligence of the employes of the railroad company in managing the car or by reason of negligent conduct on the part of the plaintiff himself in attempting to alight while the car was in motion. Accordingly, the judge told them that "in respect to carrying passengers a railroad company is bound to exercise all the care and skill which human prudence and foresight can suggest to secure the safety of their passengers." The Court of Appeals, by a vote of five judges to two, has declared it to be erroneous. "The obligation of carriers of passengers," says Judge John Clinton Gray, who writes the prevailing opinion, "to exercise the highest degree of care which human prudence and foresight can suggest, only exists with respect to those results which are naturally to be apprehended from unsafe roadbeds, defective machinery, imperfect cars, and other conditions endangering the success of the undertaking." In the case under consideration the plaintiff, if his story be true, was injured by reason of the negligent manner in which the driver attempted to take his car over the switch and, under such circumstances, say the majority of the Court of Appeals, "the defendant was only liable for the failure of the driver to use that skill and care which would be required of an ordinarily careful and prudent man."

This doctrine, which, by the way, is directly opposed to all previous rulings, including those of the Court of Appeals itself, is not generally accepted. Judge Roger A. Pryor disputed its correctness in the Court of Common Pleas, and Judge Denis O'Brien and Judge Irving G. Vann dissented in the Court of Appeals on the ground that "the reason which requires the highest degree of care by a carrier of passengers with reference to roadbed and machinery extends with equal force to the use of the roadbed and machinery in the operation of cars. There should not be a higher degree of care required in providing appliances than in using them."

It is pointed out that the views of the dissenting members of the court are in harmony with the law as declared by the Court of Appeals itself more than 30 years ago, in the case of Maverick against the Eighth Avenue Railroad company, and re-

peatedly laid down since then. In the Maverick case the accident had absolutely nothing to do with any defect or imperfection in the road or car, but the passenger was injured in consequence of the negligence of the conductor in stopping the car so that it collided with a hook and ladder truck; yet the Court of Appeals unanimously held that the defendant was subject to the rule that "passenger carriers bind themselves to carry safely those whom they take into their coaches, so far as human care and foresight will go," and because the conductor failed to exercise that degree of diligence in the operation of his car, the verdict against the railroad company was sustained.

In the case of Coddington against the Brooklyn Crosstown Railroad company, also presented in the New York reports, it is shown that the accident occurred by reason of the negligence of the driver of a horse car in crossing the line of a steam railroad as an engine came along and struck the car. Here, also, the fault of the defendant was not in failing to provide a proper car or proper appliances, but in failing to use the car carefully with reference to the safety of the passengers, and the Court of Appeals, speaking through Judge Robert Earl, reiterated the familiar rule in these words: "That under such circumstances the defendant was bound to use the highest degree of care and prudence, the utmost skill and human foresight, is the settled law."

This new ruling, however, will tend to unsettle things, and if it be finally adhered to it will doubtless prove of great benefit to street-railway companies.

M. S.

PERSONAL.

Lyon Playfair, the well-known English chemist, is dead.

Dr. Charles E. Emery of Brooklyn, the eminent mechanical engineer, is critically ill. Dr. Emery is a highly esteemed member of the engineering profession, and his western friends will unite in a cordial hope for his recovery.

Russell Stanhope, the vice-president and secretary of the St. Louis Electrical Supply company, will shortly make a European trip. Mr. Stanhope sails for England on June 8th, and will, in all probability, be in that country and on the continent about two months. Mr. Stanhope is an Englishman, and will take this opportunity of visiting his old home. He expects to return to America.

ELECTRIC LIGHTING.

Bids will be received up to 8 p. m., June 13th, for purchase of Reno (Nevada) electric-light bonds amounting to $20,000, or any portion thereof; also proposals with plans and specifications, to construct and establish an electric-light plant for the city of Reno.

The Common Council of Lockport has entered into a contract with the Lockport Gas and Electric Light company to light the city for three years. The contract provides for 250 electric lights and 96 gas lamps. The price for each electric light is to be $78.

A meeting of the Redlands (Cal.) Electric Light and Power company has been called, to be held July 21st, for the purpose of considering and voting upon the question of increasing the capital stock of the incorporation from its present sum of $200,000 to the sum of $500,000, and also for voting on the question of increasing the bonded indebtedness of $100,000 to $400,000.

Of the 2,986 vessels which passed through the Suez Canal last year, 2,837 employed the electric light for navigating during the night. As a result of this increased use of the electric light the mean duration of passage for all vessels passing through the canal shows a constant and satisfactory decrease. Last year the average duration was only 17 hours 44 minutes, against 18 hours 38 minutes in the previous year, and in 1897 the percentage of vessels navigating by night was 95 per cent., against 94 per cent. in 1896.

The subject of street lighting is interesting Geneva, N. Y. The Common Council of that city rejected bids of the Welsbach Gas company and the Geneva Light and Power company. The bid of the Geneva Light and Power company was as follows: Eighty-five arc lights, 2,000 candle power, every night in the year, three-year contract, $97.50 per light; same number of lights, five-year contract, $95; three-year contract, 325 nights a year, $92.50; five-year contract, $90; three years from and after May 1st, 100 arc lights, every night, to 4,000 hours, at $.02325 per light per hour.

A call has been made for a small electric plant for lighting the dredges engaged in searching the beds of the rivers of the South Island, New Zealand, for gold, which is now a successful industry and promises to extend in the future. The plant required is that of a dynamo capable of supplying two lights of 1,500 candle power each, one of 500, two of 200, and one of 100, making a total of 4,000 candle power. The main lights would swing from 75 to 100 feet from the dynamo, and the others with an average length of 50 feet. Special stress is laid upon the need for small floor space, simplicity of construction and ease of manipulation. Some inquiries have already been received from the United States. The price quoted should be for the apparatus complete and ready to operate.

ELECTRIC RAILWAYS.

The franchise for an electric railroad from Los Angeles to Whittier, Cal., has been granted to A. B. Patton.

The franchises, rolling stock, plant, etc., of the Pasadena and Los Angeles Electric Railway company have been sold to Don C. Porter of Pasadena, acting as a representative of the reorganization committee, for $150,000.

The Indiana Gas Belt electric railway was put in operation on May 28th, between Anderson and Summitville and Marion and Fairmount, leaving but five miles to connect up to complete the Marion-Anderson line. The Elwood line is well under way, and the Muncie line will be started at once. The Indianapolis branch will be built this year or early next spring. This is Indiana's first electric railway, and when completed it will be one of the longest systems in the country, covering over 100 miles. The equipment is high class. Congressman Henry is at the head of the system.

It is said that at the meeting of the Chicago City Council on June 6th a 50-year franchise for a new South Side overhead trolley street-car system will be asked by the Union Transit company. Beginning at Jackson boulevard and Pacific avenue, and continuing through 20 miles of streets to the terminal at Sixty-seventh street and Woodlawn avenue, the proposed right-of-way covers the territory now occupied by the Chicago City Railway company. The Union Transit company is said to have been incorporated a year ago with a capital of $500,000. It is said that Lucius Clark, who is reported to be its president, has been quietly working, and has secured frontage consents along the right-of-way.

The Manchester, N. H., street railway has passed into the hands of Tucker, Anthony & Co. of Boston. It is 14 miles long and last year netted $12,000 above expenses, paid five per cent. on its bonds and a nine per cent. dividend. The new directors are W. A. Tucker of Boston, president; P. L. Saltonstall of Boston, Walter M. Parker and Charles T. Means of Manchester and E. P. Shaw of Boston. Messrs. Tucker, Anthony & Co. also own the Manchester Electric company, which does a gross business of $125,000 a year and furnishes electric power to the street railway. Mr. Saltonstall is president of the electric company and W. A. Tucker treasurer. It is proposed to consolidate the companies.

Articles of consolidation of the Pasadena and Pacific Railway company of Arizona and the Pasadena and Pacific Railway company of California were filed last month in Los Angeles, Cal. The two companies which have thus been merged into one will be known by the name of the Los Angeles-Pacific Railway company. The original electric road to Santa Monica by way of Sherman, and now known as the "old line," was built by the Arizona company. Later a company was incorporated by the same interests under the laws of California, and built the "new line" by way of University and Rosedale, both companies were controlled by the same men and their consolidation is merely a legal step and does not mean that there has been any change in the management of the road.

The Bluff City electric street railway has been sold to a new corporation, the Chicago and Milwaukee Electric Railway company, which proposes to complete the construction and equipment of the road. The directors are George A. Ball, A. C. Frost, George M. Seward, F. S. Reeves and C. E. Loss. Mr. Ball is president, Mr. Frost vice-president and treasurer, and Mr. Seward secretary. The new company has a capital stock of $1,000,000, and it will execute a mortgage securing an issue of $1,000,000 bonds. It is estimated that it will cost $750,000 to complete the road, which will then be 35 miles long. Work is in progress between Waukegan and Highland Park, and 4.4 miles are in operation between Waukegan and North Chicago, and four miles between Highland Park and Fort Sheridan. The stretch between Highland Park and Waukegan will, it is expected, be completed in about 60 days, while the plans provide for the extension of the line to Evanston by October 1st.

The Buffalo and Lockport Railway company has been incorporated to operate an electric road from Buffalo to Lockport, N. Y. The capital stock of the company is $1,000,000. The length of the proposed road is to be 29½ miles, and the principal office is to be located in Pendleton Center, Niagara county. The directors named for the first year are as follows: Hon. W. Caryl Ely and Hon. Frank A. Dudley of Niagara Falls; Robert L. Fryer, H. J. Pierce, G. H. Dunbar and Burt Van Horn of Buffalo; John A. Merritt, S. Curt Lewis and Frank M. Ashley of Lockport. The board of directors has organized by electing Hon. W. Caryl Ely president, Henry J. Pierce vice-president, Burt Van Horn secretary-treasurer and general manager. The company's line will commence at the center of Hertel avenue and Virgil street in Buffalo, run along Hertel avenue to Kenmore avenue, to Delaware street, Tonawanda, to Young street, to Delaware street, across the Ellicott Creek, Erie Canal, Tonawanda Creek, to Main street, to Sweeny street, to the Tonawanda-Lockport branch of the Erie road, which tracks it has leased and will use to Lockport, where it will be connected to the lines of the Lock City road by a switch at the corner of Main and Transit streets.

TECHNICAL SCHOOLS.

In announcing the plan of instruction for the summer quarter, the West Virginia University of Morgantown, W. Va., does not neglect the engineering students, as courses on physics, chemistry, geology, civil and mining engineering, mechanical engineering and mechanic arts and applied mathematics are provided. William S. Aldrich, M. E., is the professor of mechanical engineering. The summer quarter will begin on July 1st and continue 12 weeks. It is not a "summer school," but is an integral part of the work of the university. It is to be noted, also, that the West Virginia University gives instruction by correspondence to those who desire to take a college course, but are prevented, by financial or other reasons, from attending college in person.

The twenty-eighth annual catalogue of the Worcester (Mass.) Polytechnic Institute, recently issued, shows 216 students, a large proportion of whom are taking the course in electrical engineering. The degree of bachelor of science is conferred on graduation. The degrees of mechanical, civil and electrical engineer are only conferred on graduates after from three to seven years of professional work of an acceptable character. In electrical engineering the course appears to be thorough and the laboratories are well equipped for work. Dr. T. C. Mendenhall is the president of the faculty and Harold B. Smith is the professor of electrical engineering. Entrance examinations are held at the institution on the 20th, 21st and 22d of this month and on Monday, September 12th, and succeeding days of that week. The Journal of the Worcester Polytechnic Institute is a bi-monthly magazine devoted to the interests of engineering and technical science. It contains articles of practical value from graduates. H. C. Smith is the editor.

ELECTRICAL SECURITIES.

The Chicago City Railway company has declared its regular quarterly dividend of three per cent.

The State Board of Railroad Commissioners of Massachusetts has approved an issue of $10,000 six per cent. 20-year bonds and $17,000 stock to the Conway Electric Street Railway company for funding debt incurred in an extension of the road to Deerfield. New six per cent. bonds have been almost unheard of in New England the last few years.

The Board of Railroad Commissioners of Massachusetts has granted an increased issue of stock to the Springfield Street Railway company to the amount of $291,700 for the purpose of capitalizing its floating debt and expense incurred by addition to its plant. The market value of its new stock is to be $150 a share. The company petitioned for an increase of $300,000.

The Edison Electric Illuminating company of Brooklyn reports gross earnings for April of $73,590, an increase of $5,605 as compared with the same month last year, and net $31,413, an increase of $544. For the four months ended April 30th the gross earnings were $310,369, an increase of $17,089 as compared with the corresponding period of last year, and net $143,084, an increase of $4,533.

A trust mortgage for $2,000,000 was filed in the register's office in Brooklyn, May 25th, by the Coney Island and Brooklyn Railroad company to the Mercantile Trust company on property at Smith and Huntington streets and Coney Island avenue and King's Highway, and upon the franchises of the company, to secure an issue of four per cent. bonds made necessary by the consolidation agreement with the Brooklyn City and Newtown Railroad company.

The Cicero and Harlem Street Railway company has filed a mortgage for $1,000,000 to secure an issue of bonds of like amount. The proceeds will be used to build the 2½ miles of the Chicago Lake street elevated extension, which property the mortgage covers. The mortgage is in the form of 1,000 bonds of the denomination of $1,000 of date of April 1st and maturing April 1, 1938, bearing five per cent. interest. Under the resolution passed by the stockholders authorizing the issue of the bonds, the company is also permitted to issue additional bonds to the extent of 75 per cent. of the cost of any permanent improvements or extensions that may be made.

Considerable activity was manifested in street-railway securities in New York last week. The heaviest trading was in Manhattan railway, which enjoyed a maximum advance of 2½ points. The movement was accompanied by rumors of an agreement between the company and the Rapid Transit Commission, and also of an alliance between the company and the Metropolitan Street Railway company. Neither report was confirmed, and the chances are that the advance was brought about chiefly by the temerity of professional operators in selling short a stock that is very closely held. Metropolitan Street Railway, after advancing

sharply, reacted as sharply and closed fractionally lower than when the movement began.

A mortgage for $15,000,000 was executed in Newark last week on behalf of the Manhattan Trust company of New York by the reorganized North Jersey Street Railway company, which has absorbed the Consolidated Traction company and now controls nearly all the trolley lines of Northern New Jersey. This mortgage covers all of the company's property in Essex County, and is given to secure $15,000,000 of gold bonds of $1,000 each for 50 years. The bonds are guaranteed for four per cent. per annum after May 1, 1899.

The gas and electric-light commissioners of Massachusetts have issued an order permitting the Dedham and Hyde Park Gas and Electric Light company to issue $60,000 first-mortgage bonds at five per cent. to run 20 years. Twelve thousand dollars is to cancel indebtedness, and $48,000 for enlargements. The commission, for the first time, uses its power to limit dividends, for the purpose of securing a reduction of capital. The company voted to reduce its stock from 2,000 shares, par value $50, to 1,600 shares, by exchanging shares for notes. This would not, of course, in any way decrease its indebtedness, and so the commission, by its order, provides that it shall not declare any dividends above three per cent. until a sufficient number of stock certificates have been canceled to carry into effect the vote to reduce the stock, or until otherwise ordered by the board.

MISCELLANEOUS.

At the Glasgow International Exhibition in 1901 special attention will be given to the section of electricity for lighting and power purposes. The guarantee fund for this exhibition already exceeds $1,750,000.

The San Diego (Cal.) Union of May 20th says that a large wave motor is being constructed at Oceanside by Schuyler Bros., which will furnish power to operate an electric-light plant, which is to be provided soon.

The relation between electric power and the house-fly nuisance does not seem apparent; but it is claimed, nevertheless, that the most hopeful token of the abatement of flies in cities is to be found in the substitution of electricity for horses on the street railways. Practically all flies are bred in stables, it is said, and therefore the fewer stables the fewer flies.

The Supreme Court of New York has just rendered a decision in the case of William Bracken against the Atlantic Trust company, for $151,124.82, in favor of Mr. Bracken. This was a suit to recover damages for the detention by the Atlantic Trust company of 30,000 shares of the capital stock of the Consolidated Electric Storage company of New York, to the delivery of which Mr. Bracken claimed to be entitled.

The Royal Academy of Sciences of Bologna, says Nature, announces that a gold medal, in memory of Aldini, will be awarded in 1899 for the best essay on animal electricity. The essays may be either in Italian, French or Latin. They may either be in manuscript or printed, but they must not have been published longer ago than two years before the award. Papers competing for the prize are to be sent before May 29, 1899, addressed to the secretary of the Royal Academy of Sciences of the Institute of Bologna.

The new tariff of Chile, which went into effect on the first day of January last, imposes a general duty of 25 per cent. ad valorem, and, in addition to that, there are several special classifications. Boats, if made of wood, for electric propulsion, pay 15 per cent. ad valorem; launches, iron or steel, electric, 15 per cent. ad valorem. Instruments, telephonic, telegraphic, insulators, iron or steel posts and all other special accessories for telegraphs and telephones, with the exception of the wooden cross-pieces for the posts, are admitted free of duty. Machinery, apparatus and special accessories for gas and electric lighting, with the exception of all kinds of lamps, not including arc and incandescent lamps for the electric light, are also admitted free of duty. Material of iron or steel for the permanent way of electric railways is free of duty.

TRADE NEWS.

William Roche of New York says that the independent telephone companies are taking very kindly to the "New Standard" dry batteries, and that the government is not behind. A large type of cell is being used on the cruisers for gunfiring, measuring 1.6 volts and giving a current of five amperes. It is said that it can give 17 amperes, but the life would be correspondingly lessened.

Stone & Webster, electrical experts and engineers of Boston, have recently published a small book in which is given some statistical matter regarding street-railway and electric-lighting properties in Massachusetts. There are 64 electric-lighting companies in the state, they say, and the "return on capital stock is 5.4 per cent. Outside of Boston this figure is diminished to 2.2 per cent."

Kaufman Bros. of Pittsburg, Pa., have placed an order with the Electric Arc Light company of New York for 400 Pioneer enclosed arcs, for use in their new building. A unique feature of this installation will be the complete lighting of the store with arcs and gas chandeliers. This is the first store in the country to be entirely equipped in this manner. Pioneer lamps were selected after a three months' competitive test.

The Fostoria Incandescent Lamp company of Fostoria, O., is a new concern which makes a specialty of the best work. Its recent exhibition at New York was very attractive and included what is claimed to have been the only successful 220-volt incandescent lamp at the exposition. The company turned out its first lamps in October, 1897, and its success has been mainly due to the efforts of its able superintendent, Mr. Hermann F. Schaedel, well known to the electrical fraternity, and to the skillful management and untiring push of the president of the company, Mr. J. B. Crouse.

The Westinghouse Electric and Manufacturing company has recently completed a novel electric plant for the Fletcher Manufacturing company of Providence, R. I. Until recently two engines were used by this company, one on each side of the street. Desiring to shut down one of them, it was found impossible to run a shaft under the street, but permission was secured to lay electric wires. The single engine will now operate the entire plant, by running a 150-kilowatt, 400-volt, two-phase Westinghouse generator, which transmits current across the street to a 200 horse power motor.

BUSINESS.

On receipt of postage, the Chicago Fuse Wire and Manufacturing company will send for ten days to anyone in the trade, a suitable box for holding legal papers or other valuables.

The Warren Electric and Specialty company of Warren, Ohio, announces that it is receiving a large number of suggestions of names for its new lamp, and as each suggestion must be accompanied with an order, it is correspondingly busy.

The direct-current desk and bracket fans of the Western Electric company are discussed in Bulletin 3-F. The motors are wound for 110, 220 and 500 volts, and may be run at three speeds. All the motors are designed for continuous running at any of the three speeds without sparking and without heating. A price-list is printed in the bulletin.

Chairs, tete-a-tetes and loungers in the observation car on the New Pennsylvania Limited are remarkable pieces of furniture in design, finish and convenience. They are something entirely new, and give the observation room the appearance of a grand parlor. For details about the train and route apply to H. R. Dering, assistant general passenger agent, 248 South Clark street, Chicago.

Bernard Hartley, manager of the Hartley Electrical Works, Chicago, reports an excellent business. The company is well known as one of the leading repair concerns of Chicago and has turned out many a noteworthy job in its line. Mr. Hartley is a man of wide experience in the business, having been connected for many years with the Westinghouse company. The company also deals in new and second-hand apparatus.

President W. N. Mathews of the St. Louis Electrical Supply company reports a fine demand for electric fans from all over the Southwest. The St. Louis Electrical Supply company is handling the Emerson alternating fan and the Western Electric direct-current type. It makes a point of carrying a large stock, not only of fans, but other electrical supplies, which should prove decidedly advantageous to buyers throughout the Southwest. President Mathews reports the outlook for business as being most encouraging; in fact, the establishment has often to work in the evenings to keep up with orders for construction material.

Bulletin No. 17 (replacing No. 6) of the Wagner Electric Manufacturing company of St. Louis is devoted to ventilating fans direct-driven by electric motors. A complete line of this apparatus has been placed on the market by the Wagner company. The motors are for direct current and wound for 110, 250 or 500 volts, and the fans are furnished for erection in three styles. Twelve speeds can be obtained by controlling rheostats. The great merit of these outfits, as compared with the desk fan and pedestal fan, is that they renew the air rather than simply stir it up. For public halls, restaurants and all other places where a great many people frequently assemble, in mines, cellars, etc., where foul air naturally accumulates, they are said to be a sanitary necessity.

In the line of suppying electric-power equipments for factory use the Westinghouse Electric and Manufacturing company has been particularly successful of late. It reports the following sales: Berlin Mill company, Berlin, N. H., two 180-kilowatt generators and a number of induction motors for driving planing and grist mills; M. G. Shaw Lumber company, Bath, Me.; Fries Manufacturing company, Salem, N. C., six induction motors to operate fertilizing machinery; Dennison Manufacturing company, South Framingham, Mass., three direct-current generators of 330 kilowatts total capacity and 17 slow-speed motors for driving shop machinery; Lyman Mills, Holyoke, Mass., one 225-kilowatt two-phase generator and six induction motors for the operation of spinning frames, mules, looms, etc.

The Electric Appliance company has recently closed a general western agency arrangement for the celebrated Armorduct interior conduit. The Armorduct is the latest product of the Armorite Interior Conduit company, manufacturer of the well-known Armorite steel-armored interior conduit. The Armorduct is a steel tube heavily enameled inside and outside by a special and exclusive process. The enamel placed on this tube gives a perfectly smooth interior, with a coating which will withstand a temperature of 500 degrees. Bending and twisting the tube will not crack or break the coat of enamel. Further than this, the enamel is absolutely proof against the action of cements or acids of any description. The Electric Appliance company considers that it has a very valuable specialty in Armorduct, and large sales are prophesied.

The Boiler Expurgator company of Chicago has issued a neat pamphlet extolling the merits of the boiler expurgator manufactured by it. This article is designed to remove the scale from steam boilers, and save money by holding the surface of the boiler in a natural condition, thus necessitating the use of less fuel than a boiler which has from one sixteenth to one-half inch of scale on its surface. The boiler can be run a longer time between washings, which reduces the expense of more frequent washing. The advantage of longer runs is that it avoids the serious injuries that result from frequent heating up and cooling off boilers. Repeated extremes of contraction and expansion are hard on boilers. The boiler expurgator prevents and removes scale, is said to be a sure preventive of foaming, and it is claimed that it is effective in all kinds of water. The boiler expurgator is the result of a long series of experiments made by a master mechanic, and consists of ingredients never before used for boiler-cleaning and foam-preventing purposes. It is in use in many of the prominent plants, and is said to give entire satisfaction.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued May 24, 1898

604,358. Valve-controlling Device. Walter S. Alexander, New York, N. Y. Application filed February 24, 1896.

A valve-controlling device is described. One feature is the operation of two auxiliary valves by an electromagnet suitably mounted on the main-valve stem.

604,373. Automatic Telephone Exchange. Ward Decker, Owego, N. Y. Application filed March 25, 1895.

The principal features are a short-circuited telephone receiver, a circuit-breaker for breaking the short-circuit, an electromagnet for operating the circuit breaker, all in combination with a calling-generator connected with the electromagnet, whereby the short, circuit is broken on operating the calling-generator.

604,384. Electric Heater. Edward E. Gold, New York, N. Y. Application filed October 14, 1897.

An electric heater comprising an insulating open-work support consisting of a thin foraminous tube and a helix of resistant wire wound helically around the support, whereby air may circulate between the meshes of the helix and through the openings into and out of the interior of the support and into contact with all portions of the heated resistance wire.

604,418. Accumulator Plate. Isidor Rosler, Berlin, Germany. Application filed March 10, 1898.

The plate consists of a continuous zigzag core piece, the surfaces of which on both sides are fitted with triangular webs wholly separated from each other.

604,431. Electric Signal for Railway Crossings. Leon C. Smith, Columbus, Ohio. Application filed May 18, 1897.

An arrangement of electromagnet and stop projections at a railway crossing to ring a bell automatically on the approach of trains.

604,434. Telephone Signal System. Wallace A. Stilwell and Alexander Barneck, Salina, Kan. Application filed November 10, 1896.

The second claim describes a telephone switchboard comprising two series of fixed contacts arranged in concentric circles, a common conductor normally connected with each contact of one of the series, a series of wires arranged in pairs, the ends of the wires of each pair terminating in a contact in each series, a switch arm movably secured relatively to the series of contacts and normally electrically connected with the common conductor and permanently connected through a telephone station with the ground; this switch is adapted to simultaneously connect with the contiguous ends of any pair of wires in the series.

604,453. Secondary Electric Clock. Aaron D. Blodgett, Newton, Mass. Application filed May 20, 1897.

The mechanism of an electrically controlled clock is described.

604,459. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed March 20, 1897.

The meter is provided with a rotating armature, field-coils connected in series in an electric circuit, volt-coils co-operating with the field-coils to set up a shifting magnetic field to actuate the armature, a transformer having a primary coil in shunt across the circuit, a closed-circuit secondary coil between which and the primary coil a consequent magnetic field is set up and a tertiary coil wound to inclose the lines of the magnetic field and connected in series with the volt-coil.

604,460. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed August 6, 1897.

This instrument has an annular armature and a plurality of magnetic fields, part of which are set up within and part without the armature, two fields being arranged on the same side of the annular wall of the armature on separate axes located on opposite sides of the axis of a field on the other side of the annular wall from the two fields, and means for producing a phase displacement between the inner and outer fields.

604,461. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed August 6, 1897.

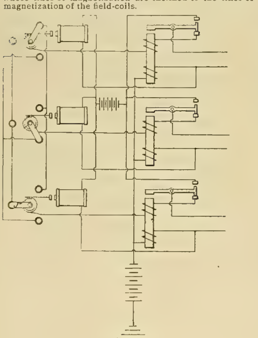
Especially designed for multiphase currents, this meter is equipped with a rotary armature, a pair of series coils, one connected in one circuit from the generator and the other connected in another circuit from the generator, and two sets of shunt-coils, the set adjacent to each series coil being connected in the other circuit from that in which its adjacent series coil is connected.

604,462. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed August 11, 1897.

The combination of an annular rotary armature, a magnetic field exterior to the armature, a plurality of magnetic fields within the armature and having intersecting axes, each of which is arranged at an angle to the axis of the exterior field, and a friction compensating magnetic axis arranged at right angles to the axis of the exterior field, is described.

604,463. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed August 26, 1897.

In a motor-meter, a revoluble metallic armature and a series of field-coils without the armature whose adjacent poles are in close proximity thereto, and in such relation that the resulting intersecting lines of magnetization are at right angles to each other; this is in combination with an equal number of volt-coils located within the armature whose lines of magnetization are inclined to the lines of magnetization of the field-coils.



NO. 604,373.

604,464. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed September 11, 1897.

This meter is for alternating-current circuits. The method of measurement consists in setting up or establishing a shifting field of magnetism from three intersecting lines or axes of magnetization, and is adapted to actuate a rotatable armature in a motor-meter arranged within the energizing coils producing the lines of magnetization.

604,465. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed September 24, 1897.

In a meter for measuring large electric currents a stationary field conductor having a detachable section, a disk-like armature comprising a series of sector-like coils, and arranged in inductive relation to the conductor and a commutator provided with proper contact-brushes.

604,466. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed November 8, 1897.

This is a motor meter and comprises a series field representing the main current, a revoluble armature in inductive relation to the field, a volt-coil or coils arranged in inductive relation to the armature, a secondary coil closed through a suitable resistance and acting inductively in co-operation with the volt-coil or coils upon the armature, and a compensating device comprising an iron core and a closed circuit or secondary, the compensator being adapted for adjustment relative to the armature.

604,471. Electric Brush. [illegible] M. Hellwig, Chicago, Ill. Application filed December 11, 1896.

In the back of the brush is a cavity, containing a small battery and two metal sockets out of contact with the bristles, but connected with the battery poles. An insulated conductor connects the bristles with one of the sockets. The brush handle has an insulated contact plate, which is connected by a wire with the other socket in the cavity. Manipulation of the contact plate controls the current.

604,499. Multiple Telephony and Telegraphy. Richard Pfund, New York, N. Y. Application filed October 22, 1897.

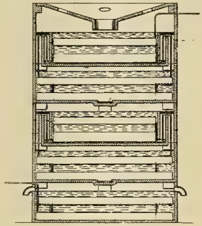
A through metallic circuit having telephone stations included therein or connected therewith, signaling magnets for the stations bridged across the two wires of the circuit, an extra circuit uniting the middle points of the signal-magnets whereby an independent circuit is obtained between the stations, and instruments for communication, located in the extra circuit.

604,501. Motor Wattmeter. Carl D. Raab, Kaiserslautern, Germany. Application filed December 27, 1897. Patented in Belgium June 30, 1897, and in Spain July 10, 1897.

This is a motor-meter for measuring watts. The essential features are two horseshoe electromagnets, a disk armature and a main-current solenoid at the other side of the disk from the magnets.

604,508. Electric Clock. William Whitehead, Manchester, England. Application filed June 7, 1897.

An electric clock mechanism is described.



NO. 604,588.

604,511. Driving Mechanism for Dynamos. Philemon W. Alexander, Allapaha, Ga. Application filed September 21, 1897.

Mechanical means of conveying the power from the axle of a car truck to a dynamo pulley are described.

604,533. Combined Transmitter and Receiver. John M. Joy, New York, N. Y. Application filed June 21, 1897.

An improved printing-telegraph apparatus is covered by this patent.

604,544. Electrical Governor. Mark A. Replogle, Akron, Ohio. Application filed February 19, 1897.

In combination with an electrical governor having a pair of electromagnets, a pair of insulated electrical contact-points by means of which electrical circuits may be completed through the magnets, the insulating contact-points being separately adjustable and jointly movable.

604,588. Storage Battery. Herbert S. Lloyd, Philadelphia, Pa. Application filed December 23, 1896.

A series battery comprising a number of superposed cells, overflow-partitions in each cell communicating with an opening in the bottom of the cell, and arranged to form passages for the overflow of the excess of electrolyte into the cell below, electrode-supports in the cells, and connecting wires or strips extending between adjacent cells.

NO. 604,626

604,616. Automatic Resetting Fusible Cut-out. John D. Holmes and Webster L. Heath, St. Louis, Mo. Application filed April 12, 1897.

In a fusible cut-out, a movable member, fuse-holding devices carried by the movable member and normally locking it, the fuse-holding devices being arranged in pairs and insulated from each other, means for releasing the movable member when a fuse is burned out, and line-wire terminals adapted to be put in electrical communication with one pair only of the fuse-holding devices at a time.

604,626. Electrical Lighting Device for Kerosene or other Burners. Svend M. Meyer, Brooklyn, N. Y. Application filed January 27, 1897.

A device for lighting oil lamps by electricity comprising a suitable lamp-body, a burner separable therefrom, a source of electricity in the body or base of the lamp grounded by one pole in the lamp-body, an insulated conductor from the other pole, an igniting device mounted on the removable burner grounded by one end in the metal of the burner and connected at the other end with an insulated conductor, insulated contact devices carried by the lamp-body and removable burner respectively and respectively connected to the insulated conductors therein, so as to form electric connection between the insulated conductors when the burner is placed in position, and a suitable device for closing the electric circuit by hand.

604,679. Incandescent Electric Lamp Regulator. Daniel McF. Moore, New York, N. Y. Application filed February 10, 1892.

The third claim is for an automatic circuit-breaker in the circuit of the lamp filament, with provision to make and break, rapidly and continually, the circuit through the lamp filament.

604,680. Electric Lamp Regulator. Daniel McF. Moore, New York, N. Y. Application filed October 13, 1894.

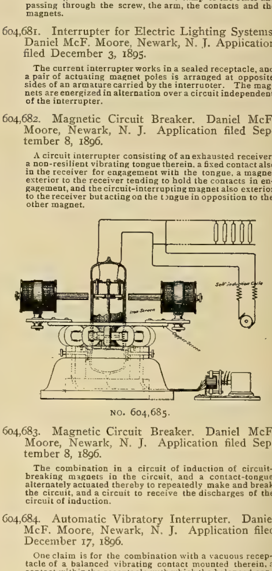
The combination with the base of an incandescent electric-lamp socket of an electromagnet, a bulb having a vacuum or inert atmosphere, a vibratory armature within the vacuum within inductive relation to the magnet, a flexible arm carrying the bulb and movable to and from the magnet, an insulating-stop for limiting the movement of the bulb from the magnet, a screw provided with a handle passing through the socket-frame and movable to and from and against the arm, and electric contacts within the bulb and controlled by the armature, the electric circuit being from one terminal of the lamp to the other and passing through the screw, the arm, the contacts and the magnets.

604,681. Interrupter for Electric Lighting Systems. Daniel McF. Moore, Newark, N. J. Application filed December 3, 1895.

The current interrupter works in a sealed receptacle, and a pair of actuating magnet poles is arranged at opposite sides of an armature carried by the interrupter. The magnets are energized in alternation over a circuit independent of the interrupter.

604,682. Magnetic Circuit Breaker. Daniel McF. Moore, Newark, N. J. Application filed September 8, 1896.

A circuit interrupter consisting of an exhausted receiver, a non-resilient vibrating tongue therein, a fixed contact also in the receiver for engagement with the tongue, a magnet exterior to the receiver tending to hold the contacts in engagement, and the circuit-interrupting magnet also exterior to the receiver but acting on the tongue in opposition to the other magnet.



NO. 604,685.

604,683. Magnetic Circuit Breaker. Daniel McF. Moore, Newark, N. J. Application filed September 8, 1896.

The combination in a circuit of induction of circuit-breaking magnets in the circuit, and a contact-tongue alternately actuated thereby to repeatedly make and break the circuit, and a circuit to receive the discharges of the circuit of induction.

604,684. Automatic Vibratory Interrupter. Daniel McF. Moore, Newark, N. J. Application filed December 17, 1896.

One claim is for the combination with a vacuous receptacle of a balanced vibrating contact mounted therein, a contact within the receptacle with which the balanced contact co-operates to make and break circuit, magnets for vibrating the balanced contact, and a striker for jarring the receptacle occasionally to insure the continued operation of the balanced contact.

604,685. Electric Lighting Apparatus. Daniel McF. Moore, Newark, N. J. Application filed February 15, 1897.

In a rotary current interrupter contained within a sealed receptacle, the combination with the armature in the receptacle of means for producing a rotating field to rotate the armature, the means comprising a fixed system of windings similar to the armature system of a dynamo-electric machine or motor, a rotating commutating device for the system and a circuit of self-induction exterior to the sealed receptacle and connected through the walls thereof to the contacts of the interrupter.

604,686. Apparatus for Producing Luminous or Similar Effects. Daniel McF. Moore, Newark, N. J. Application filed July 3, 1897.

Luminous effects are produced by interrupting a circuit of induction to which vacuous receptacles and interrupter contacts are attached.

604,687. Circuit-interrupting Mechanism. Daniel McF. Moore, Newark, N. J. Application filed September 9, 1897.

The combination with a vacuous receptacle of a circuit interrupter therein, a motor for driving the interrupter, the rotary part of which motor is within the receptacle and has its coils insulated and thoroughly imbedded in a vitreous mass.

604,688. Circuit Interrupter. Daniel McF. Moore, Newark, N. J. Application filed September 10, 1897.

A circuit-interrupter consisting of a metallic foundation provided with openings or depressions and successive layers of a vitreous insulating substance deposited therein and having a fused connection with the metal, the surface of the metal and insulation made level and smooth.

Western Electrician.

EVERY SATURDAY.

Vol. XXII. CHICAGO, JUNE 11, 1898. No. 24

Alden M. Young, President National Electric Light Association.

The newly elected president of the National Electric Light association, Mr. Alden M. Young of Waterbury, Conn., has for many years been closely identified with central-station work throughout New England, and of late he has extended his operations to New York. He may be said to have been engaged in electrical pursuits all his life and is acquainted with every class of service, including telegraphy, telephony, lighting, power transmission and street-railway work. At present he is particularly interested in commercial lighting and is establishing a large central station in the borough of Brooklyn, although he still retains his interests in the New England enterprises which he had established before venturing into the metropolitan project.

Mr. Young is a forceful character, as will be readily appreciated by glancing at the accompanying portrait. Possessed of great energy and natural ability, he has developed a capacity for organization and executive management that has already commanded recognition on the part of capitalists and managers of electrical properties. These characteristics will be appreciated more fully after an acquaintance with what he has already accomplished.

Mr. Young was born at Hadley, N. Y., in 1853, and passed his boyhood days in that neighborhood. His first practical experience was gained in the telegraph business, which he entered immediately upon leaving school. He secured a position with the old Atlantic and Pacific Telegraph company and was stationed successively at Saratoga, Albany, Syracuse, Buffalo, and finally at New York. In 1878 he became interested in telephony and organized an exchange at Waterbury, Conn., which ultimately became a valuable property. He extended his operations and entered the electric-lighting and street-railway field, organizing several companies and contributing largely to the successful introduction of these systems in several New England towns.

Mr. Young has done much to raise the standard of engineering and construction work throughout the territory in which he has operated. He formed the New England Engineering company of Waterbury and is now president of that concern. It is engaged in general engineering and construction work, including steam plants and gas works, as well as electrical engineering.

Mr. Young is actively engaged in the management of several operating companies, and it is said that he is an officer in at least a dozen more in Connecticut, Massachusetts and New York. Among those with which he is prominently identified are the Central Railway and Electric company of New Britain, of which he is president, the Waterbury Traction company and the Norwich Gas and Electric company, in both of which concerns he occupies the position of secretary. Some idea of the magnitude of the interests involved in these enterprises may be gained from the fact that the three concerns just mentioned represent an investment of $1,600,000 in capital stock and $1,483,000 in bonds. The New Britain concern furnishes current for 260 arc lamps, 13,000 incandescent lights and 1,600 horse power in motors. The electrical equipment of the Norwich concern comprises an arc and alternating incandescent system supplying current to 217 arc lamps and 3,000 incandescent lights. The motor service aggregates 380 horse power. The Waterbury plant has a "mixed system" of 400 arcs, 8,000 direct-current incandescent and 5,000 alternating-current incandescent lights. The plant also furnishes current to motors of 1,950 horse power capacity.

It will be understood from this brief outline of President Young's career that he has had considerable experience in central station electric-lighting business and is thoroughly equipped for the office to which he has just been elected. But it should be mentioned that the most important work of his career is that in which he is now engaged in the establishment of the Kings County Electric Light and Power company. Mr. Young is general manager of the new concern, and he is now personally superintending the building of the company's station in Brooklyn.

ALDEN M. YOUNG, PRESIDENT NATIONAL ELECTRIC LIGHT ASSOCIATION.

Northwestern Electrical Association.

The plans for the Northwestern Electrical association convention were perfected in all their details during the week, many members of that organization assembling in Chicago while the National Electric Light association was in session. President Copeland was an early arrival, and he aided materially in securing members for the trip.

The steamer Northwest, which was tied up at Kirk's dock on Thursday was visited by a large number of Chicagoans.

The party started for Milwaukee Friday afternoon. Several representatives of Duluth, Houghton and the Soo, who came to Chicago early in the week, accompanied the association as an escort. One of the inducements offered was an invitation to witness the newest wonder in American engineering, the Red Jacket shaft of the Calumet and Hecla—the greatest mining shaft in the entire world. It is 4,900 feet deep, and, compared with it, the deep silver mines of the Comstock lode in Nevada, or the wonderful mines of Austria, are said to be but shallow pits. There are six compartments, each equal in size to an ordinary mining shaft, four of these being used for hoisting rock and lowering timber, one is used for the ladderways, while the sixth compartment carries the wires and pipes for telephones, light, power, water and compressed air. The underground workings of the shaft are laid out with mathematical accuracy, the undeviating course of the copper-bearing lode allowing work to be planned thousands of feet ahead of the mineral picks. The great pumps which free the mine of water are operated interchangeably by compressed air and electricity. The party expects to spend a day at these mines.

As already announced, the programme provides for an informal discussion of several topics, including "Electrical Measuring Instruments," "Lightning Arresters," "Transformers," "Meters," "Arc and Incandescent Lamps," "Motors," "Engines," "Furnaces" and "Mechanical Draft." A paper on "Electrical Smelting of Ores," by W. S. Horry, is the principal feature.

Control of Alley "L," Chicago.

Announcement is made that several directors of the South Side Elevated Railroad company and certain directors of the Chicago City Railway company have reached an agreement, which, if carried through, will again place the elevated property in the control of interests identified with the South Side surface system.

On Monday it was reported that the City Railway had already secured control of the "L" road by private sale, but this is denied. The story is that the parties in interest contemplate a campaign against South Side "L," which will force its price down to a reasonable buying point from the City Railway point of view. It has been observed that certain large South Side "L" interests which were enthusiastic on the property are now only lukewarm in their praise of it as an investment. Only recently dividends were predicted at an early period, but now the management professes not to see any distribution on the stock in sight. It is stated that certain South Side "L" directors who have not been let into the alleged deal have gotten wind of the fact that it is on and are preparing to do all in their power to block it.

While it is true that only recently the City Railway let control of the South Side 'L" get away from it, it is also true that many large stockholders of the surface-line company condemned as very unwise the policy which permitted this, and it would seem that the position of the latter was indorsed by the present management of the City Railway, when only a few months ago it exploited a project for an elevated strcture in Dearborn street. The plans, with considerable detail, were given to the public, but since the first announcements were made no action toward carrying out the scheme has been taken. Those who believe the reports about a deal between the City Railway and the Alley road insist that the Dearborn street "L" stories were given out without sincerity as a bear point on South Side "L," and regard the announcement simply as a feature of the alleged deal now working.

If the City Railway does again get control of the Alley Elevated, it will probably use it as a trunk line, to which all the long-haul traffic from its electric lines will be transferred. The company's need of an entrance to the congested heart of the city over an elevated way was strongly presented by President Bowen when he explained the Dearborn street "L" plans not long ago.

The City Railway owns a good-sized interest in the South Side Elevated already, and the fact that it is preparing to increase its holdings, until it controls the elevated competitor, is believed by many to be the cause of the 40-point advance in its stock lately recorded. Friends of the company who predicted a price of 300 for the City Railway last week now talk of 350 for it.

Although it is not possible to confirm this story, it finds many firm believers among investors in this class of securities.

Other sources of information convey the impression that the alleged deal is far from being an assured fact. Some go so far as to say that the rumors have no basis in fact, that the elevated road is not for sale and that the management is concerned only with the development of the property. So far as this process has extended along the line of loop extension and electrical equipment, the results have been encouraging, both in increase of traffic and economy of operation. There remains the problem of extending the line to Englewood, a branch of which the road stands in need, and which it is expected would contribute at least 10,000 passengers a day. It is admitted that certain interests in the City Railway and the South Side favor a consolidation, but it is equally possible that other interests are strongly opposed to the only terms which have been mentioned. Some of the strongest elevated interests consider par a fair price for their stock, figured on its prospects, while the City Railway is hardly willing to pay that price. Meanwhile it may be said that the predictions of the management as to the future of the property are having steady fulfillment.

NATIONAL ELECTRIC LIGHT ASSOCIATION.

The Chicago meeting of the National Electric Light association was a successful gathering in every respect. The attendance was large and representative, the meetings were well attended, the programme proved attractive and the papers presented provoked much discussion. More attention was paid to the proceedings than ever before in the history of the organization, and in this respect at least the Chicago convention will mark a departure from the experience of the association in former years.

Every paper and every topic of discussion on the programme proved an attractive feature, and the fact that every session was prolonged beyond the time originally set, owing to the interest manifested in the discussions, proves conclusively that the subjects chosen for consideration were wisely selected and the method of handling them suited for the purpose. Every detail had been carefully planned and was executed with precision.

Tuesday's Proceedings.

The meeting room was taxed to its utmost capacity when President Insull called the twenty-first convention of the National Electric Light association to order at 11 o'clock Tuesday morning in the Auditorium Hotel, Chicago, and formally opened the proceedings by reading his annual address, which is herewith appended:

President Insull's Address

In calling to order the annual convention of your association my dual capacity presents somewhat of an embarrassment to me. I am in doubt whether as president to enlarge upon the great growth of this association since its formation in this city on February 25, 1885, or whether as a resident here to dwell at length upon the marvelous growth of the city in which we meet. Chicago and the industry with which we are identified have a somewhat close connection. The growth of the former, if measured from the point of view of the rapidity with which history is made, is, so to speak, the product of yesterday. The electrical industry, or rather that portion of it with which we are associated, is but little more than the product of to-day. If the growth of this city and that of our own industry is as great during the next 13 years as the progress that they have achieved since the date of your first meeting here, I am sure that both the citizens of Chicago and the members of your association will have every reason to congratulate themselves. Speaking for those of my friends connected with the electrical industry in Chicago, and also for myself, I can assure you that it affords us very great pleasure to welcome you at this convention, and the fact of your meeting in this, my home city, enhances not a little my high appreciation of the privilege of presiding on this occasion.

The officers of your association have had in mind in preparing a programme for this convention the importance of bringing before you subjects of interest in connection with central-station management, and the papers to be read at our various sessions and the topics mentioned for discussion cover such a wide range that it would seem undesirable for me to occupy much of your time by way of introduction. The various gentlemen who have so kindly consented to read papers will deal with such important questions as the cost of generating and distributing the product which we manufacture, transformer economy, and the rival claims of alternating currents and direct currents as means of distribution. The many problems which you have to solve in connection with the question of public lighting and the cost of producing electrical energy by water power, will also be discussed.

Standard vs. Special Machinery.

A matter which has called forth during the last year considerable discussion is the question of the use of standard apparatus and the tendency towards the specification of special machinery on the part of electrical engineers. This course is not by any means confined to large work, but is followed by some engineers whether they are designing a small isolated plant or are projecting a large modern central station. It would seem to me to be of paramount importance to the manufacturer and user that both should co-operate in eliminating as far as possible from the business the necessity of building and using special types of machinery. This can only be done by the adoption of standard specifications for various standard types of apparatus. A committee of the American Institute of Electrical Engineers has already taken this subject under consideration, and I believe that we will be serving alike the interests of the manufacturers and users of electrical apparatus if we will take some action with a view to co-operating with the Institute and other bodies in this matter. In drawing attention to this subject I speak with an appreciation of the position of both manufacturer and user, having had more or less connection with the manufacture of electric apparatus and the manufacture of electric current. Constant duplication of parts resulting in constant duplication of a given piece of machinery means, as any manufacturer will tell you, constant reduction in cost. Variation from a given type means increased cost and even the wiping out of an apparent profit. In the last year or so there has been a great deal of discussion in England prompted by the success of American manufacturers in obtaining large contracts for electric-traction work in Great Britain, and the inquiry has often been made, how is it possible for American electrical manufacturers, with high wages against them, to compete with English builders, whose scale of pay to their workmen is on a very much lower basis. If you will examine into the amount of electric-traction machinery manufactured in this country under a system of constant duplication and the use of special tools, and then visit the electrical establishments on the other side of the water and note the tendency there towards specializing each particular job, you will soon recognize that the reason for low cost and consequently low selling price on this side of the ocean, is brought about by the fact that in America this class of work

MEMBERS AND VISITORS AT THE CHICAGO CONVENTION.

The social features of the meeting proved highly agreeable to those who participated. They are considered more in detail elsewhere in this issue.

The opening meeting was attended by four ex-presidents of the association, Judge Armstrong of Camden, N. J., Mr. Ayer of Boston, Professor Weeks of Kansas City and Mr. Wilmerding of Chicago. There were also two visitors from Japan, who were greatly interested in the proceedings, and several Canadian engineers and one Mexican visitor were included in the gathering.

It is worthy of remark that from the opening of the first session to the conclusion of the last business on Thursday, the proceedings were conducted expeditiously and interest was maintained throughout. Mr. Insull proved a very efficient presiding officer, and much credit is due him for the success which attended the convention.

The meetings were held in the large banqueting hall on the sixth floor of the Auditorium Hotel, and the quarters proved very well adapted to the needs of the association. A detailed report of the proceedings is herewith presented.

is largely designed by the manufacturer, and, as a natural result, is the duplicate of something already produced, while on the other side of the Atlantic the builder of the machinery works from the plans of the electrical engineer, which necessitates his producing something different to fill each different contract. In one case the machinery is really manufactured; in the other case the builder runs a jobbing shop. Unfortunately, during the last few years American users of electrical apparatus have somewhat departed from the pursuance of what is really a fundamental principle of American manufacture, namely, the use of existing types which are turned out in large quantities with special tools, with a view to the lowest possible cost of production. The electrical engineer for the purchaser has been permitted to draw up specifications which have tended towards the specializing of apparatus, necessarily interfering with rapid manufacture and low cost of the product. The disadvantage to the manufacturer is apparent. It is turning our large electrical works from manufacturing establishments into jobbing shops, cutting down their capacity, increasing their labor cost and lengthening the time that it takes to produce a given article. Looking at it, therefore, from the point of view of the manufacturer, the capacity of his plant is reduced, and consequently his interest and general expense cost is higher; his labor cost is increased; and if he finds himself unable to increase his selling price, his shop must be run at a loss instead of at a profit.

The user is necessarily interested in low cost of production on the part of the manufacturer, as he cannot expect to purchase apparatus except at prices which yield a return to the maker. From this point of view alone it would seem to me to the interest of the user that he should co-operate with the manufacturer with a view to standardizing apparatus, eliminating unnecessary variations from a given type and providing specifications for machinery calling for a given capacity at a given efficiency. Such a course would lead to low cost of manufacture and consequently low selling price, coupled with rapid production.

Another objection to special apparatus is the expense and delay in obtaining duplicate parts in case of breakdown. The fear of delay under such circumstances often necessitates the user carrying the duplication of his plant to a point entirely unnecessary when standard apparatus is used. Capital investment and consequently interest cost is thus increased, not only by the purchase of apparatus which of itself is expensive to build, but also by the duplication of investment, which I have pointed out must of necessity follow.

A further point which should be borne in mind in connection with the lack of standard specifications is the opportunity that it gives to the unprincipled manufacturer to dispose of his second-rate apparatus to the unmuated. We talk of a machine having a given capacity, but under what conditions should it operate to develop this capacity, and how often does it occur that a dynamo machine is rated entirely too high and at the cost of its efficiency? How much miscellaneous material used in connection with the industry is absolutely unfitted for the purpose for which it is sold? Surely all of us, manufacturers and users are interested in maintaining the highest possible standard of work and eliminating alike from our central-station systems and the installations for our customers worthless appliances whose only recommendation is their apparent cheapness; whereas, as a matter of fact, they are really the most expensive that can be bought, because they are unfitted for the purposes for which they are intended. A proper consideration of this subject would not embrace alone the apparatus we are ourselves in the habit of buying for use in connection

CALVIN W. RICE.

with our plants, but also the appliances used in connection with customers' house wiring. It should be borne in mind that faulty apparatus, from one cause or another, resulting in a stoppage of the service of one or more customers is, in the mind of the user of current, set down to the unreliability of the system as a whole. A central-station customer seldom discriminates between a contractor who supplies a worthless device and a company supplying him with current. Standard specifications should therefore cover not alone the machinery used, but also the devices and material forming part of a customer's installation. This association has addressed itself at various times to the consideration of questions in connection with house wiring, and has co-operated with the National Board of Fire Underwriters and other bodies with a view to establishing rules to be followed by contractors. I strongly recommend that this matter be taken up on a broader basis than heretofore, and that in connection with the technical societies we invite the co-operation of the electrical manufacturers with a view to standardizing apparatus and the specification thereto, whether for use in the central station itself or in connection with the distributing system.

I do not want my remarks on this subject to be taken as in any way censuring the many electrical engineers who have by their special training and natural ability done so much to develop the industry with which we are connected. From my experience I am satisfied, however, that from the point of view of the user, the designing engineer who adapts his requirements to the standard apparatus of a first-class manufacturer, is able to produce a plant of more satisfactory character and more economical to operate than that designed by those engineers whom, I regret to say, are sometimes influenced by the desire to use machinery which they can claim as their own handiwork, rather than use something that would be quite as satisfactory and has the advantage of being the regular product of an established manufacturer.

The consideration of the subject of standard specifications would naturally include the preparation of specifications with relation to the manufacture of incandescent lamps. For several years past a committee of this association has had this subject under consideration. It has been found practicable by a number of large central-station companies connected with another association and buying from one manufacturer to purchase their lamps under specifications which provide for the testing of samples of the product of the factory, the payment for lamps supplied being based on the results of the tests. It seems to me that it would be possible to adopt standard specifications under which our members could purchase their lamps from any reputable lamp manufacturer. The importance of this matter will be appreciated when it is remembered that the cost of lamp renewals per unit of output exceeds $1 per ton of the cost of fuel in operating a central station, with the most modern steam plant.

Selling Price Based on Cost.

It is of prime importance to central-station managers that they should sell the product they manufacture, namely, electric current, to the greatest number of consumers at the lowest possible price, and yet obtain a reasonable profit. For a number of years the basis of charge on the part of most companies has been a given unit price, with discounts for quantity. In the early days of the business some companies were in the habit of charging a fixed price per lamp per month, having no control whatever over the use of the product, but being necessarily responsible for the increased operating expenses caused by the wastefulness of customers, who could hardly be expected to economize, inasmuch as they paid exactly the same price for the use of light, whether they burned it one or 24 hours a day. A majority of these companies, however, following this last method realized at an early date the absurdity of distributing that for which they were not paid, and, as a result, I presume we can fairly assume that electric lighting business (with the exception of arc light services) is run almost universally on a meter basis. It is therefore unnecessary for us to discuss the question as to whether the measuring of current is a desirable thing in our business, as it is now generally recognized as a necessity. If you will make a careful examination of the factors, as

CAUCHING PART STARTING FROM AUDITORIUM.

tering into the cost of current you will very quickly come to a realization of the fact that interest is by far the most important single element, and that this item varies very considerably with the different classes of service furnished by a central-station company. The interest factor in cost depends upon the yearly average consumption of your product by the customer; or, to put it another way, you can figure your interest on the basis of so much per unit of output at maximum load. For instance, take the two probably extreme classes of customers to whom the central-station company supplies current for lighting purposes. On the one hand, you have an office building whose tenants only use artificial illumination for a very short space of time each day during the winter only. On the other hand, you have a basement customer whose use of your prod-

WAGNER COMPANY'S HEADQUARTERS AT CHICAGO CONVENTION.

uct averages nearly one-half of the day of 24 hours during the whole year. Your investment, to take care of each of these customers is practically the same; therefore, your total interest cost must be the same in both cases, but if you distribute this interest cost over the actual units consumed you will find that the tenant of the office building costs you for interest per unit of current sold many times more than does the occupant of the basement. There are, of necessity, as many different grades of customers between the two extremes I have mentioned as there are different classes of business and different characters of structures in which these businesses are conducted. Surely, if the cost of production varies according to the different conditions under which your customers use your product, it is but fair that the selling price per unit should vary correspondingly. If it does not, you, of necessity, encourage the use of electricity by customers whose business is unprofitable to you, and discourage the use of your product by customers whose business at a lower price would yield you a fair return. In past conventions the questions of how to improve the day load for the purpose of raising the average output, what classes of business should be encouraged other than lighting to achieve this result, and the price at which we can afford to sell current to the operators of these different lines of business, have come up for discussion. At the last convention the realization of the fact that great differences exist in the elements governing the cost of product for different classes of lighting customers, was ably presented by Mr. Arthur Wright, and he pointed out that the improvement of your load factor, the broadening of your curve and the rendering less acute of your peak is a matter within your own adjustment, providing that you will realize in considering cost with a view to making a selling price, that conditions are so dissimilar that the expense to you per unit of supplying two customers in the same block is likely to be widely different. Various plans have been adopted by a comparatively small number of companies to meet the conditions as we now know them to exist. Some companies have adopted the scheme of allowing certain special discounts, providing the income per month per lamp connected exceeds a certain amount. Other companies charge one rate for current used during certain specified hours of the day and a much lower rate for the current used during the remaining hours of the day. A third method is a system of discounts based upon the total consumption of current during a given period, considered in connection with the maximum consumption at any time during that same period.

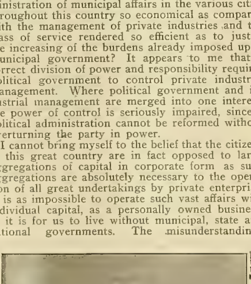
These various methods all have the same object in view, namely, the meeting of the conditions of each individual customer, and yet at the same time earning a fair return on all of the investment provided for all of your customers.

In discussing this matter I have referred alone to interest cost because it forms so large a proportion of the total cost, but you will find that this same principle enters into a number of the other elements which go to make up your total cost. It would therefore appear to me that in considering the cost of generating electricity you should bear in mind that a large proportion of the [illegible] which go to make up the total are within [illegible] control and their amount per unit of output depends very largely upon the methods adopted in selling your product.

Public Control and Private Operation.

A subject of growing importance to a number of our members is the question of the public ownership and operation of the undertakings now operated by electric lighting companies. The agitation in connection with this subject has called forth a great deal of discussion, partly by those interested in it simply with a view to extending the influence of political parties, and partly by serious disinterested thinkers who believe that the best interests of the greatest number are to be obtained by the creation of a municipal socialism, which, if carried to its logical conclusion, must ultimately result in municipalities performing, with others, such public-service work as we are engaged in, and also in producing the food we eat and the clothes we wear. To those occupied in the management of electric-lighting properties it does not seem possible that the movement in favor of municipal operation of electric-lighting plants, based upon the assumption that a municipality can produce electricity cheaper than, or even as cheap as, a private corporation is well founded. We all realize from the close attention we have to give to our own affairs, that self-interest and the necessity of getting a return on our investment are the first essentials to the economical administration of large enterprises. While I do not pretend to claim that electric-lighting companies are beyond reproach, I wish to point out that many of the evils complained of as pertaining to corporate management are the direct results of the enforcement of unwise conditions through legislative action. Ill-advised efforts are often made by legislative bodies to secure advantages in the direction of control which cannot be obtained without giving an equivalent in protection to the industry. This causes the investor to feel that his property is being attacked and compels him to resist such legislation. The result is a feverish agitation, crimination and recrimination, between the would-be improvers of municipal government and the owners of corporate properties without reaching a conclusion satisfactory to either. The fallacy of the so-called reformer's theory results from looking only at what he calls the injurious effects of corporate management without taking into account its indisputable benefits. He does not seek for the cause of the trouble. If reformers will take accurate account of all the points in the problem they will discover that the evils complained of result from errors in legislation designed to determine the relations between municipal bodies and electric-lighting companies. It seems to me that the claim that municipal operation is the universal cure for all diseases for which electric-lighting companies are supposed to be responsible, merely proposes the substitution of political in the place of industrial management. This raises the question: Is the administration of municipal affairs in the various cities throughout this country so economical as compared with the management of private industries and the class of service rendered so efficient as to justify the increasing of the burdens already imposed upon municipal government? It appears to me that a correct division of power and responsibility requires political government to control private industrial management. Where political government and industrial management are merged into one interest, the power of control is seriously impaired, since a political administration cannot be reformed without overturning the party in power.

I cannot bring myself to the belief that the citizens of this great country are in fact opposed to large aggregations of capital in corporate form as such aggregations are absolutely necessary to the operation of all great undertakings by private enterprise. It is as impossible to operate such vast affairs with individual capital, as a personally owned business, as it is for us to live without municipal, state and national governments. The misunderstandings

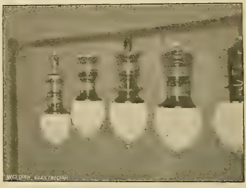


KASTER CARBON RHEOSTATS AT CHICAGO CONVENTION.

which, from time to time, occur between communities and the managers of electric-lighting companies will, to my mind, disappear entirely if the relations between the two are correctly founded on the basis of public control, with corresponding protection to the corporations operating this industry. It would seem to me to be a very proper function for this association to address itself to educating the public to a definite legislative policy which will be fair to the municipalities, securing to the public the best service at the lowest possible price, and protect corporations by giving them franchises, which, while conserving municipal control, will insure to the investor the permanency of the undertaking.

Competition Is Not the True Regulative Force.

It is supposed by many who discuss municipal affairs that the granting of competitive franchises for public-service work is the true means of obtaining for users the lowest possible price for the service rendered, whereas, as a matter of fact, the exact opposite is the ultimate result. This is proved by results in all large cities where the most severe competition has taken place. Acute competition necessarily frightens the investor, and compels corportations to pay a very high price for capital. The competing companies invariably come together, and the interest cost on their product (which is by far the most important part of their cost) is rendered abnormally high, partly owing to duplication of investment and partly to the high price paid for money borrowed during the period of competition.



STERLING ARC LAMP COMPANY'S EXHIBIT AT CHICAGO CONVENTION.

The selling price of a service should be based on its cost, and in any business such as public work, where the investment is large and the annual turnover is comparatively small, if the item of interest be unnecessary augmented, it must be reflected in the price paid by public and private users.

While it is not supposed to be popular to speak of exclusive franchises, it should be recognized that the best service at the lowest possible price can only be obtained, certainly in connection with the industry with which we are identified, by exclusive control of a given territory being placed in the hands of one undertaking. In most European countries public-service operations enjoy exclusive franchises, under proper control, and are able to obtain capital for their undertakings at the lowest commercial rates, thus materially affecting the cost of their product, of which interest, as I have already stated, is necessarily so great a part. In order to protect the public, exclusive franchises should be coupled with the condition of public control, requiring all charges for services fixed by public bodies to be based on cost, plus a reasonable profit. It will be found that this cost will be reduced in direct proportion to the protection afforded the industry. The more certain this protection is made the lower the rate of interest and the lower the total cost of operation will be, and, consequently, the lower the price of the service to public and private users. If the conditions of our particular branch of public service are studied in places where there is a definite control, whether by commission or otherwise, it will be found that the industry is in an extremely healthy condition, and that users and taxpayers are correspondingly well served.

Compensation for Franchises

When prices for services are based on cost it matters not whether in the establishment of a system of legislative control provision is made for paying a portion of the receipts direct to the municipality. If the public demands a percentage, surely we can afford to pay it, as it would simply be added as an item of expense on which our selling price would be figured. If the public does not demand a percentage, this selling price would be proportionately less. It is simply a question as to whether our municipal bodies prefer to raise a portion of their income by taxing their citizens through the agency of public-service corporations, or whether they prefer to raise that portion of their income by collecting it direct from citizens themselves. Revenue raised by a percentage on gross receipts of the electric-lighting business would, at the present time, however, seem to be somewhat unfairly obtained in cases where the selling price is subject to legislative control and based on cost of service, as the result would be that a small minority of citizens using electricity would be forced to contribute largely to the public revenue, whereas the benefits enjoyed therefrom would be to the advantage of the whole community.

Taking Private Property for Public Use

Another point that should be included in a proper scheme of public control is a condition under which the municipality would have the right to purchase the undertaking. Such a right should include a direct obligation on the part of the municipality to purchase the property at a fair price whenever it is thought desirable that the industry should be operated by the municipality. The possibility of the exercise of the right of purchase by the municipality would of itself make it to the interest of the owners of the property to do their full duty in their relations to the public. On the other hand, if a com

munity licenses a corporation to perform a certain public service, and if that corporation invests its money and develops its business, surely it is unfair for that community to go into the same line of public-service work itself without first purchasing the existing plant. If this is not done the value of private property will be destroyed without just compensation being made therefor in an attempt to secure a public benefit. I do not believe that the people, as a whole, are so unfair as to demand that such a course be taken.

My recommendations on the subject, which I have just presented, are by no means original. Most public-service corporations in Great Britain are run on practically the basis indicated, and in more than one state in the union corporate legislation has taken the same direction.

I would summarize the position which I think we should take on this subject in just two sentences.

First—Franchises granted to public-service corporations should secure them the same degree of protection in their rights to their property as is enjoyed by other investments.

Second—Public control of charge for service based on cost, plus a reasonable profit, and eliminating the factor of competition, is the proper safeguard for the interests of users, taxpayers and investors.

At the conclusion of the reading of this address the regular order of business was taken up.

COMMUNICATIONS.

The president read letters of regret from the first vice-president, A. M. Young of Waterbury, Conn., Thomas A. Edison, Nikola Tesla, Professor Bovey and Prof. Thomson, who were unable to be present.

Invitations to accept the hospitalities of the following-named companies were read: Metropolitan West Side Elevated, South Side Elevated, Northern Steamship company, asking the members to "inspect" the Northwest. An invitation for the association to meet in Detroit next year was also read. The Chicago Telephone company announced that it had placed a special telephone in the rooms of the local reception committee for the use of the members and visitors. The American Telephone and Telegraph company announced that it had also placed a long-distance instrument at the disposal of the members and visitors.

PAPERS AND DISCUSSION.

The president then announced the next order of business to be the paper by Calvin W. Rice of Brooklyn, on "Cost of the Generation and Distribution of a Unit of Electricity." Several interesting diagrams were shown in connection with this paper. In the discussion that followed, President Insull produced a chart showing an analysis of the business of the Chicago Edison company, the relative importance of the several classes of business and the result of the company's experience in furnishing this service. The topic "Prices and Discounts for Electric Current and Methods of Billing Current to Customers" was considered in the same connection. Mr. Dow and Mr. Ferguson gave some interesting information on the subject of meters, and Mr. Wagner also participated. Mr. Weeks, Mr. Barker, Mr. Ayer, Mr. Scoville and Mr. Creden contributed to the general discussion, which was formally closed by Mr. Rice. This session had been prolonged until 1:30 p. m., so great was the interest manifested in the discussion, and it was determined accordingly, to adjourn until 3 p. m. Before the members withdrew, however, President Insull took occasion to commend the gentlemen in attendance for the attention they had given the papers, and he urged them to be present at the remaining sessions, promising that they would find the papers and discussions both profitable and entertaining.

When the convention was again called to order in the afternoon, President Insull announced the first paper to be that of Alex Dow of Detroit on "Public Lighting with Relation to Public Ownership or Control." This paper was followed by addresses on the same subject by Samuel Scovil of Cleveland, H. M. Atkinson of Atlanta and E. H. Davis of Williamsport, Pa., which are presented elsewhere in this issue.

At the conclusion of the reading of these papers the meeting adjourned to executive session.

Wednesday's Proceedings.

President Insull called the meeting to order at 10:30 a. m. and announced that the papers for the morning session would be on "General Distribution from Central Stations by Alternating Currents," by Herbart A. Wagner of St. Louis, and "General Distribution from Central Stations by Direct Currents," by Louis Bell of Chicago. The papers were read by the respective authors.

The president: I have pleasure in calling upon Prof. Fujioka, one of our honorary members, who is professor of electrical engineering at the Imperial University of Tokyo, Japan.

ELECTRICAL DEVELOPMENT IN JAPAN.

Prof. Fujioka: Although I have the honor to be an honorary member of your association, I have had very little opportunity to attend your conventions. I shall take great pleasure this morning in giving a short description of the plant and system which has been carried out under my direct supervision in Japan. I have no data, to be compared with the papers which have been read, so I will draw a rough map of Tokyo. We originally had five central stations. No. 1 station was originally installed in 1888 entirely with the Edison three-wire system; Nos. 2, 3, 4 and 5 were installed afterward, also on the Edison three-wire system. Before going further I would like to say that there are some conditions peculiar to Japan that had to be taken into consideration. The city of Tokyo has quite an extended area, occupying about 100 square miles, and the buildings are scattered, but we have no high buildings because of the danger from earthquakes. I saw the advantages of the Edison three-wire system of distribution, so we began to supply the more crowded parts of the city by means of the three-wire system. We subsequently found that it was necessary to supply current to more scattered parts of the town, so we added single-phase alternating currents in most of the other stations. Since we saw the advantages of the three-phase current transmission we have decided to install one big power station near the river. All the former stations were worked with high-pressure non-condensing engines, and I may state that coal in Japan, particularly in Tokyo, is very expensive, costing $5 to $6 per ton. So we found that it might be wiser to install a condensing station near the river, having triple-expansion engines. We installed ten triple-expansion engines on the condensing system, each engine directly coupled to low-speed generators, four of them single-phase and six of them three-phase generators. The three-phase generators were wound for 3,500 volts, whereas the single-phase were wound for 2,000 volts. We did not like to disturb the existing three-wire network in the crowded

WESTINGHOUSE HEADQUARTERS AT CHICAGO CONVENTION.

portion of the city, and we wanted to keep the three-wire network as we have had it for about ten years. The way I have done it was to place induction motors in No. 1 station, taking out all the engines and boilers, and placing the induction motors in the same place as we had the engines. So in the same way station No. 3 was converted in a similar way, and in station No. 2 we have four induction motors, each 150 horse power, directly connected to multipolar direct current dynamos. No. 4 station was taken down altogether. In No. 5 station we took down all the old engines and dynamos, and replaced with three-phase transformers with the four-wire system for alternating current. The other parts are coupled by means of 2,000-volt single phase currents, raising the voltage at the necessary place to the required potential. In that way we have succeeded in reducing a great deal of the expense in fuel and labor items. I cannot tell at present the exact proportion of the decrease, but we know we have reduced the expenses materially, and I shall be much pleased if this brief description will convey to you some idea of what has been done in Japan.

GENERAL DISTRIBUTION SYSTEMS.

President Insull announced that the general subject of alternating currents and direct currents for electric lighting and power was open for discussion, and an animated debate followed. Among those who participated were Messrs. Thayer, Wurts, Bump, Robinson, Dow, Wilmerding, Scovil, Rice, Pillsbury, Ayer, Fakes, Davis, Stetson, De Camp, Hubeley, Chandler, South, Walbank and Carnes.

It was found necessary to adjourn before concluding this discussion, and the subject was again taken up in the afternoon. President Insull took the floor during the afternoon and made a very interesting address on the commercial features of the problems, and Messrs. Ferguson and Wagner were called upon to elucidate some point raised or reply to the criticisms on the respective systems advocated. The convention adjourned until Thursday morning, when the discussion was finally concluded.

Thursday's Proceedings.

President Insull called the meeting to order at 10:40 a. m. The first paper read was on the "Cost of Producing Electric Power by Water Power from the Lachine Rapids, Canada," by W. McLea Walbank of Montreal, Canada. In the discussion which followed the reading of this paper, Messrs. Wagner, Ferguson, Insull, Fakes, Davis, Matlock, Rice, Anderson and Walbank discussed the several points involved.

The president then introduced Prof. W. E. Goldsborough of Purdue University, Lafayette, Ind., who read an interesting paper on "Transformer Economy." Mr. Layman led the discussion on this subject, and was followed by Messrs. Thayer, Wurts, Wagner, Davis, Matlock and Walbank.

NOMINATING COMMITTEE.

The president: I beg at this time to announce the committee to nominate officers and members of the executive committee for the ensuing year. I will appoint as a nominating committee the following-named gentlemen: A. M. Robertson, Minneapolis, Minn.; James R. Dee, Houghton, Mich.; James L. Ayer, Boston, Mass.

The closing session of the convention was held on Thursday afternoon, and, like all other sessions, was well attended. President Insull called the members to order for the last time at 2:55 p. m.

COMMITTEE REPORTS.

The first business was the report of the committee on "Standard Candle Power of Incandescent Lamps," of which Dr. Louis Bell was chairman. Mr. Ayer presented the report of the committee, as follows:

"Your committee has been able to have tested in the most careful manner, through the courtesy of Prof. W. L. Puffer of Boston, 16 incandescent lamps from 11 different makers. The lamps were obtained directly from the makers or their authorized agents and were known to be for test.

"These lamps were all sold for 16 candle power 110 volts, no watts specified, and may be fairly assumed to represent the product which would be shipped to consumers who did not desire the lamps for test, although one batch of lamps came with the bases marked, to show the point to be turned toward the photometer screen.

"On test these lamps, 33 in all, averaged 14.1 mean normal candle power and about 11.7 mean spherical candle power. Only one batch of three averaged over 16 normal candle power. One batch fell below 11 normal candle power, and two below 12 normal candle power. Five makers fell below 14.5 normal candle power. The highest average of any batch was 16.09, the lowest 10.82. The average consumption of energy was almost exactly four watts, the lowest 3.78 watts per candle, and two batches ran over five watts. It should be noted that the voltage was determined by a Weston voltmeter, freshly compared with Clark cells, and each lamp was marked at its voltage (110).

"A separate series of tests showed that these lamps on the average gave their mean spherical candle power, when measured under rotation, with their axes tilted 45 degrees until 30 minutes from the vertical toward the photometer, thus confirming closely

your committee's estimate of 45 degrees as a proper angle.

"A series of tests on proper speed of rotation showed that the best results were obtained with a speed of 200 to 250 revolutions per minute, and that the lamps would readily stand this speed.

"Many of the lamps showed bad spherical distribution, which seems to be quite needless, since it is merely a matter of proper proportioning the form of the filament.

"Of an equal number of batches of 32 candle power lamps only one batch averaged 32 normal candle power, the majority falling to from 26 to 28 candle power. The 32 candle power lamps averaged slightly greater efficiency, but were otherwise much like the 16 candle power size.

"From this investigation the fact stands out that the incandescent lamp sold for 16 candle power is, on the whole, a lamp which is often giving considerably less than its rated candle power, even when new. Some of these lamps would probably show a temporary increase of candle power, after, say, 50 hours' burning, but the committee has not extended the research in this direction as yet, and adheres to the opinion that the initial candle power is the only practicable commercial test, and any increase, consequently, is simply to be regarded as a device for keeping the lamp a little longer from its inevitable decay.

"From these and other data kindly furnished by manufacturers, and obtained from various other reliable sources, your committee is convinced that the need of a uniform rating is even greater than it concluded in the preliminary report of last year, and that a rating test, in order to be effective, must involve measurement of candle power of lamps in more than one direction. Neither mean horizontal nor mean spherical candle power, nor candle power in any one direction, will define a lamp well enough to insure adherence to the rating. Your committee, therefore, recommends that incandescent lamps be required to conform both to a standard mean normal candle power and to a mean candle power when revolved with the axis tipped 45 degrees, this representing the spherical distribution. It recommends that the limits for the mean normal candle power be 15 and 17.5 candle power. Unless the minimum be as high as 15 there will certainly be found a tendency to produce lamp near the lower limit. The 45 degrees candle power should be at least 85 per cent. of this minimum. This is not an excessive requirement, and will tend to prevent working near the lower limit of horizontal candle power, unless with a lamp very good in other respects.

"Your committee has blocked out a standard form of photometer, a type of which it proposes to build, to test and put at the disposal of the association, with directions for proper use.

"It is suggested that testing be by sample, a lot of 10 lamps being taken from each barrel. Of these no lamp when run at its marked voltage shall show less than 15 nor more than 17.5 candle power, mean horizontal, when rotated at 200 to 250 revolutions per minute, and no lamp shall give when thus rotated at 45 degrees inclination less than 85 per cent. of the above minimum.

"The committee will make arrangements for standard lamps as indicated in the preliminary reports to go with the standard photometer."

Mr. Rudd said: I move that the report of the committee be adopted, that this committee be discharged and another committee be appointed to continue the work.

The motion was carried, and the president appointed as a committee: Chairman, James I. Ayer of Boston; Louis A. Ferguson of Chicago and Calvin W. Rice of Brooklyn.

The committee on "Amendments to Freight Classification" requested further time to report, and the matter was postponed until the next meeting.

The committee on "Legislation Concerning Theft of Current" made a verbal report, in which it stated that the committee had collected laws passed in 27 different states, bearing on this subject, and recommended that the same be published for the benefit of the members of the association.

The recommendation of the committee was adopted, and a new committee was formed, as follows: Chairman, E. A. Armstrong of Camden; James I. Ayer of Boston and A. W. Field of Columbus.

Miscellaneous Business.

The meeting then adjourned to executive session.

The report of the secretary and treasurer was presented, showing the affairs of the association to be in a flourishing condition.

Place of Meeting.

On motion of Mr. Armstrong, the following resolution was adopted:

"Resolved, That the annual meeting shall be held in May or June in each year, alternately in the cities of New York and Chicago, unless otherwise directed by the executive, and on such date as the committee shall determine."

FIG. 1. CENTRAL ELECTRIC COMPANY ON FIFTH AVENUE.—SALESROOM.

Resolution of Thanks.

On motion of Mr. Atkinson a vote of thanks was passed to President Insull for his untiring efforts for the success of the Chicago convention.

Mr. Ayer moved that the thanks of the meeting be extended to the Chicago Edison company, the Metropolitan West Side Elevated road, the South Side Elevated road, the Northern Steamship company, the Chicago Telephone company, the American Telephone and Telegraph company and all others who had extended courtesies to the convention, for their kindness in so doing.

Mr. Field moved a vote of thanks to the reception committee for their very considerate attention to the ladies accompanying the delegates to the convention.

Election of Officers.

The following-named officers were elected for the ensuing year:

President—A. M. Young, Waterbury, Conn.

First vice-president—E. H. Rollins, Denver, Colo.

Second vice-president—F. A. Gilbert, Boston, Mass.

Members of the executive committee—Samuel Insull, Chicago, Ill.; Samuel Scovil, Cleveland, O.; H. M. Atkinson, Atlanta, Ga.; F. A. Copeland, La Crosse, Wis.

The convention then adjourned sine die.

Social Features.

The preliminary reception tendered to members and visitors by the local electrical interests at the Auditorium Hotel on Monday evening was the principal social event of the meeting and proved to be a most enjoyable affair. Many of the eastern members had arrived and there was a large delegation from the West and Northwest. The Chicago electrical fraternity was also well represented and there were many ladies present. The rooms were beautifully decorated and excellent music was furnished for dancing. Refreshments were served in an adjoining room, and the evening passed very pleasantly.

The coaching party on Tuesday was thoroughly enjoyed in spite of the shower which at one time threatened to spoil the day's pleasure. Three coaches filled with ladies attending the convention started from the Auditorium Hotel at 11:30 a. m. The visitors were taken through Michigan avenue, Grand, Oakland and Drexel boulevards, Washington and Jackson Parks, to the Washington Park club-house, where luncheon was served. The following-named ladies comprised the party:

Miss Bissicks,	Mrs. White,
Miss Milligan,	Mrs. Cutter,
Miss Sutherland,	Mrs. Cutler,
Miss Bissicks,	Mrs. Morse,
Miss Coney,	Mrs. Tucker,
Miss Wiley,	Mrs. Low,
Miss Lancaster,	Mrs. Donohoe,
Miss C. Schayer,	Mrs. Perry,
Miss Ferguson,	Mrs. Harrington,
Miss Cheney,	Mrs. Wetzler,
Miss Slatt,	Mrs. Asher,
Miss Rhue,	Mrs. O'Hara,
Miss Meyers,	Mrs. Geraghty,
Miss A. Schayer,	Mrs. Kreidler,
Mrs. Smith,	Mrs. Sunny,
Mrs. Bailey,	Mrs. Buell,
Mrs. Thayer,	Mrs. Keily,
Mrs. Scribner,	Mrs. Williams.
Mrs. Freeman,	

Convention News and Gossip.

W. H. Schott and W. B. McDonald of Chicago were two practical representatives of the new Commonwealth system of central stations.

Five ex-presidents were in attendance—Weeks, Huntley, Ayer, Armstrong and Wilmerding. They received the attention their honors merited.

Mr. A. E. Lang, president of the American Street Railway association, was an interested visitor. Mr. Lang's company in Toledo controls a monopoly of the street-railway and lighting business of the town.

One of the foreign visitors was Mr. E. Dysterud, the superintendent of the Electric Light and Power company of Monterey, Mexico. Mr. Dysterud also reserved steamer accommodations for the Northwestern trip.

There was not a great deal of war talk at the convention, but the observant ones noticed with satisfaction, nevertheless, that on the covers of the official programme the national colors were securely fastened over Manila.

Miss Billings, the faithful coadjutor of Secretary Porter, was as cheery and obliging as ever. Her work has much to do with the smooth running of the conventions of the National Electric Light association, and it is always well done.

J. M. Hill was indefatigable in his work of promoting the Northwestern steamer convention. He was ably supported by President Copeland and Secretary Mercein of the Northwestern association and a considerable delegation of the members of that organization.

Luther Stieringer speaks in glowing terms of the effectiveness of the electric-lighting effects obtained at the Omaha exposition. The conditions, he says, were very favorable, and the management, with the example of the World's Fair in view, was quick to take advantage of its opportunity.

Joseph Wetzler lectured on "Electricity Direct from Coal," in the assembly room on Wednesday evening. The lecture was illustrated by stereopticon views, and was followed with interest by an audience that tested the seating capacity of the hall. Mr. Wetzler had an interesting subject, and he handled it with ability.

"Livsey's hat" became Livsey's pride before the convention was over. Mr. Livsey wore a white crush hat in the hotel, and someone conceived the idea of inscribing autographs on it. It is now covered, inside and out, with the signatures of convention visitors, sketches and caricatures. Mr. Livsey sets great store by his unique souvenir.

Calvin W. Rice, whose portrait is printed on page 341, made a favorable impression, not only in the manner in which he handled the subject of "Cost of the Generation and Distribution of a Unit of Electricity," but in the subsequent discussions. Mr. Rice is electrical engineer for the Kings County Electric Light and Power company of the borough of Brooklyn.

During the convention days no visitor could progress very far in or near the Auditorium without running into a Chicago Edison man. The "boys" of Mr. Insull's company were naturally out in force. They were very much interested in the convention, and a very large share of its success is due to their untiring efforts to make everybody satisfied, comfortable and happy.

The meeting room was none too large. It was the handsome banquet hall of the Auditorium, and there were few vacant chairs at any of the sessions. About 200 persons could find seats, but there were often listeners standing in the back of the hall. The sustained interest and high percentage of working attendance to total attendance form a high-water mark in the history of the association. President

Insull cast the whole weight of his influence for a working convention, and was well entitled to the congratulations he received.

One of the impromptu features of the convention was a hurriedly arranged theater party on Wednesday evening. This was a "stag" party, and over one hundred of the men occupied the front seats of a variety theater, and enjoyed the "gags" on the electrical men interpolated by the performers. The hosts of the occasion were the six members of a "syndicate" of Chicago and St. Louis men, who devised the affair for the entertainment of their friends.

Mr. F. C. Armstrong, who attended the convention, announced to his friends his departure for England on June 22d. Until lately Mr. Armstrong was the general agent of the Canadian General Electric company in Toronto, but he has joined the commercial staff of Dick, Kerr & Co., the English tramway contractors. Mr. Armstrong will be the manager of the electrical sales department of this important firm in London. In view of the awakening to the value of the electric-railway system now seen in many of the countries of Europe, Mr. Armstrong is looking forward to a career of activity and usefulness.

FIG. 2. CENTRAL ELECTRIC COMPANY ON FIFTH AVENUE. —OFFICES.

There were two coaching parties for the ladies. Both were interfered with to some extent by rainy weather, but in neither case could the elements successfully compete with the high spirits of the ladies. The first trip was taken on Tuesday. The party, consisting of about 40 ladies and an escort of five valiant gentlemen, left the Auditorium shortly before noon in three coaches and a carriage. Dodging heavy showers with more or less success, it finally reached the Washington Park Club, where an elaborate lunch was served. Here the ladies enjoyed themselves thoroughly, and it was unanimously decided that all had had "a good time," despite the rain. The arrangements for the outing were made by Messrs. Frank Gorton and John Jay Abbott of the Chicago Edison company, and they were thoughtfully planned. Mr. Gorton is the chairman of the house committee of the Washington Park Club. The second coaching party was given on Thursday afternoon, when the ladies were driven through Lincoln Park.

Two Japanese electrical men attended the convention. One is Prof. I. Fujioka of Tokyo, professor of electrical engineering in the Imperial College of Japan and president of the Electric Light association of Japan and the Tokyo Electric Light company. The other is Mr. Seuchi Hirota, also of Tokyo, where he is connected with the electrical importing firm of Takata & Co., of Tokyo, London and New York. Both gentlemen took an intelligent interest in the proceedings of the convention, and Prof. Fujioka participated in Wednesday's discussion of the relative merits of alternating and direct currents. When he rose to speak, Prof. Fujioka received a very cordial welcome. He described the central-station situation in Tokyo, illustrating on a blackboard the location of

FIG. 3. CENTRAL ELECTRIC COMPANY ON FIFTH AVENUE. —OFFICES.

[*Continued on page 349.*]

The Central Electric Company on Fifth Avenue.

Chicago is large; it is growing and will be larger; and, as the electrical business has been going through a similar process, it is safe to assume that Chicago is to be the prime electrical distributing center of the United States. Chicago can lay claim to having the best appointed, best arranged and probably the largest strictly electrical supply house in the world, that of the Central Electric company. This concern has just become thoroughly settled in its new location, 264, 266, 268 and 270 Fifth avenue, and a brief description of the new quarters will be interesting.

The facilities of the company's previous location at 173 and 175 Adams street, having proven inadequate to enable it to handle the constantly increasing trade, a new location was secured and entirely remodeled in a manner adapted to the company's requirements. This location is ideal in many respects, situated in the wholesale district on the line of the elevated-railway loop, between Jackson boulevard and Van Buren street, and convenient to all freight depots. The building is of modern construction, having a frontage of 180 feet on Fifth avenue and a depth of about 140 feet. One cannot miss the location, as the large Okonite sign (always associated with the Central Electric company) on the top of the building can be seen the entire length of the avenue. It is a compliment to the foresight in planning and the organization maintained to state that the large stock was moved to the new location in such a systematic manner that no delay was occasioned in making regular shipments, and the great amount of work necessary for making this record of prompt shipments under these trying conditions cannot be understood except by one who has passed through the experience.

The view on entering the building is shown in Fig. 1, which represents one-half the store or retail department. The counters extend down the right-hand side. Back of them are shelves with numerous drawers, shown in part in Fig. 3. All of the shelves and counters are constructed of quarter-sawed oak highly finished, and they present a handsome appearance. The retail department, which is also the house-goods department, is presided over by Mr. F. M. Pierce, a veteran in the business, who enjoys a large acquaintance among buyers of electrical material. In this department is to be found a multitude of various supplies used in the domestic applications of electricity, in telephony and much of the more extensive material used in the various other branches of electrical work, all arranged on the shelves and in cases in such manner that the "goods almost sell themselves." In the foreground (Fig. 1) is seen a table on which are displayed samples of the various types of fan motors. To the right of the entrance is a large board on which are arranged electrical testing instruments of various kinds, and a marble slab containing three of the latest types of Wagner switchboard instruments is very prominent. To the left are displayed various types of Lundell power motors and Wagner transformers.

Fig. 2 shows the location of the executive offices, accounting and general sales departments. These departments occupy the entire front of the first floor excepting the main entrance, and are arranged with the intention of utilizing the daylight, as well as in such a manner as to facilitate the rapid handling of the business. The offices to the left in the picture are occupied by Mr. Charles E. Brown, the secretary, Mr. George A. McKinlock, the president, and Mr. S. R. Frazier, the treasurer, in the order named. A spacious office between those of Mr. McKinlock and Mr. Brown is reserved for their private stenographers. The open offices to the right are occupied by Mr. H. F. Conley, city salesman, Mr. J. M. Knox, special salesman, Mr. Charles G. Burton, general salesman and advertising man, and Mr. F. D. Lempke, chief order clerk, in the order given. The cashier's office is at the end of the aisle. Fig. 3 gives another view of these departments, taken from a point near the cashier's window. All of the woodwork is of quarter-sawed oak and presents a very light and airy appearance.

To the left of the retail department and in the rear of the offices and accounting department is the first-floor stock room, extending across the building, and it is here that the first glimpse of the machinery or system necessary for handling the large quantities of the various articles incident to the business is seen. It is a simple organization, systematized into a definite place for everything, with everything in its place. In this department are bins, each one properly labeled and containing its definite article. These are built in tiers reaching nearly to the ceiling, the construction being shown in part in the left of Figs. 1 and 3. If these bins were placed end to end they would extend three-fifths of a mile. Here are found all of the lighter articles, sockets, cutouts, switches, house goods of all kinds, street-railway supplies, incandescent lamps, glassware, small wires, the smaller sizes of Okonite products (120 bins being devoted to the Okonite products alone), and in addition to these ample floor space is found for all original packages. This arrangement enables the stockkeeper to be constantly informed of the condition of the stock in his charge and also makes prompt shipments easy. The stock-room is separated from the shipping and receiving room in the rear by a partition which extends to the ceiling and which is very effective in keeping out the dirt and dust incident to the packing of goods.

The shipping room, a partial view of which is shown in Fig. 4, occupies the entire rear of the building and opens on a large rear platform in the alley. While the room is spacious, it is none too large for the amount of material handled. It is supplied with all of the conveniences necessary to the receiving and shipping of material, and is an excellent barometer of the condition of affairs in general. Here, as everywhere else about the establishment, is evidence of a system and organization that brings order out of what, perhaps, to the uninitiated, is chaos.

One does not have much of an idea of the quantities of bulky material necessary to have constantly

FIG. 4. CENTRAL ELECTRIC COMPANY ON FIFTH AVENUE. SHIPPING ROOM.

on hand in order to make the claim of being able to "ship from Chicago stock," until a visit is made to the basement of this establishment. In it are cross-arms, pins, insulators, glass jars, wire (tons upon tons) and conduit, iron fittings of all kinds. It is frequently remarked that a good electric wireman must be a "jack of all trades," and it is equally true, apparently, that an electrical supply house must be a department store, as so many articles not strictly of an electrical nature are carried in stock in this basement, as well as in other departments. The basement is unusually large and has a capacity of 35 carloads of material. A partial view is given in Fig. 5. This picture indicates the extent of stock carried. The basement is provided with a chute from Fifth avenue and a hoist to the shipping room and alley; it is lighted with Luxfer prisms and is provided with other conveniences for the handling of material.

The personnel of this company is so widely known that mention may be somewhat superfluous. Mr. George A. McKinlock, the president, has been identified with this company since its inception, in 1887, and its present condition and standing are undoubtedly due to his business sagacity and foresight. No one can meet Charles E. Brown, the secretary, without being impressed with his capacity for hard work and the extent of his marvelous knowledge of the intricate details of the electrical-supply business. Mr. S. R. Frazier, the treasurer, who has been associated with this company for about two years, is a man of recognized financial ability, and brings

FIG. 5. CENTRAL ELECTRIC COMPANY ON FIFTH AVENUE. —STOCK IN BASEMENT.

to the company years of experience in a similar position.

The Central Electric company has made for itself an enviable reputation for solidity and clear business sanity. It is one of the bulwarks of the electrical industry in Chicago, and, having won its pre-eminence by fair and honorable means, everyone will wish for it a continuance of the steady and healthy growth of past years.

H. P. Stow of the Gold Bank mine proposes installing an electric light service for the mining camps of Forbestown, Cal. The current will be supplied from a generator located at the mine.

The Chicago convention of the National Electric Light association may be said to have marked the beginning of a new era in the history of the organization. The meeting last week had a better attendance of central-station managers and engineers than former gatherings of the same body, and the interest manifested in the proceedings was sustained throughout. President Insull is to be congratulated upon the success which attended his efforts in arranging and directing the proceedings. Every session of the convention was well attended, some of them taxing the capacity of the assembly room, while the smallest gathering during the week was larger by far than the usual attendance at former conventions.

It was evident that the association had entered upon an era of greater usefulness, and that it had taken a new lease of life. It is to be hoped that the impetus given the organization by the Chicago meeting will not be lost.

The association is to be congratulated upon having selected for the ensuing year a presiding officer who has long been in sympathy with the body. Under his able leadership it is hoped that the National Electric Light association will thrive and flourish and become an influential factor in forming public opinion and promoting the public welfare. The Western Electrician, on behalf of the electrical fraternity of the West, extends to President Young assurances of support and hearty co-operation in every movement tending to advance the interest of the organization and the electrical industry.

The convention of the Illinois Street Railway association in Chicago during the week was an interesting meeting and should lead to good results. The association is gaining prestige, and its membership is growing constantly.

The action of the National Electric Light association in naming New York and Chicago as the places of meeting will certainly meet with general approval. The wisdom of such a course is proven by the fact that former meetings of the association held in these cities have been the most successful gatherings of the organization. Another feature that had considerable weight in the matter was the growing tendency to make the annual conventions strictly business gatherings. The days of junketing have passed, and the electrical fraternity of to-day does not wish to revive them.

An influential organization, known as the New Hampshire Development association, has determined to take an active part in state politics, with the view of overcoming the influence exerted by existing corporations. In its declaration of principles it says: "We believe the people should have the right to build steam or electric roads, when the capital has been subscribed in good faith, and the construction is desired by a majority of the legal voters of the towns through which the roads are to be built, limiting the amount of capitalization to the amount actually paid in for legitimate expenses in building the roads."

The attitude of existing corporations throughout New England, particularly steam-railroad companies in restricting competition has had the effect of provoking opposition to this class of enterprises.

We have always maintained that Henry C. Payne of Milwaukee was a wonderful man and that his genius was not fully appreciated by his conservative townsmen, and now we are more firmly convinced than ever that he is wasting his time in the Wisconsin metropolis, as people of that section call their thriving and thrifty city. Colonel Payne convinced Judge Seaman of the United States Circuit Court recently that his company could not comply with the requirements of the four-cent fare ordinance passed by the council a year ago, without inviting bankruptcy. The court, therefore, declared the ordinance invalid and it was the general belief that this would not only terminate the controversy but would mean indefinite continuation of the present five-cent fare regulation. But the colonel willed otherwise, if reports be true, and he has declared that he will voluntarily do that which he refused to be coerced into doing. And he adds that he would have done it long ago if the city had not tried to compel him. He invites attention to the fact, too, that the company will not suffer financially by the change. He is going to reverse the old saying: "First he said he would and then he said he wouldn't." Judge Seaman said it couldn't be done, but Henry C. Payne now says it can, and it is dollars to doughnuts that Henry knows more about it than the judge.

There are all sorts of cranks in this world. One class would exclude from public service distinguished citizens who, through exceptional ability, have attained prominence and won the respect and confidence of the community. It must have been one of these who introduced a bill which is now pending in Congress providing that it shall be unlawful for the director of any railroad, telegraph or express, steamship or telephone company, national bank or any member or officer of any combination or association formed for the purpose of controlling the price of any article of commerce to hold the office of president of the United States, sit in the cabinet, qualify as United States senator, representative in Congress, judge of any United States court or to be the head of any department or bureau of the government. It is explained that this measure is aimed at trusts, but it should be apparent to everyone that if enacted and enforced it would simply deprive the government of the services of many able and faithful public men whose honesty and patriotism have never before been questioned, although they have not been proclaimed as noisily and as constantly as the professions of those who encourage such legislation.

President Insull's opening address at the convention of the National Electric Light association, which has just closed, was one of the ablest documents that has ever been presented for the consideration of that organization. It revealed a thorough knowledge of the methods employed and the conditions that obtain in the electrical field to-day, as well as a familiarity with the inner history of the development of the electric-lighting industry of the country.

The remarks on the necessity of closely adhering to standard apparatus and avoiding the use of special machinery, except where absolutely necessary, are based upon experience both as a manufacturer of apparatus and user of machinery. The suggestion that the association co-operate with the American Institute of Electrical Engineers should be acted upon at once. The experience of these two organizations in leading the movement for improved construction and the adoption of a higher standard of material should encourage them to undertake the present work. It is certainly an important matter, and an intelligent consideration of the problem should lead to beneficial results.

The second division of the paper was devoted to the subject of "Selling Price Based on Cost." Mr. Insull's observations were in line with the policy laid down in his excellent paper on "Development of the Central Station," which was published in the Western Electrician last week, and substantially relates the experience of the Chicago Edison company in disposing of its product.

By far the most important feature of the address, however, was that portion dealing with the subject of municipal ownership or control of electric-lighting and similar corporations. Mr. Insull took the broad view that local governments granting special privileges to corporations had the right and were in duty bound to safeguard the interests of taxpayers, and that they should exercise a certain degree of control over such enterprises. On the other hand, he contended that private capital could furnish better and cheaper service than municipal plants, and he vigorously opposed the establishment of a municipal plant in competition with one operated by a corporation, or any other policy that would jeopard private capital. If the relations of corporations of this character and communities were clearly defined and thoroughly understood he believed that the most serious of the misunderstandings would be cleared away. Long-term, exclusive franchises under proper restrictions would ultimately be accepted as the solution of the problem, he predicted. This part of the address has already attracted widespread interest and has called forth many favorable expressions.

WAR NEWS.

Legal Aspect of Cable-cutting.—Among a number of English contributions to the discussion of the legitimacy of cable-cutting in war time is a letter from Prof. T. E. Holland of Oxford, in the London Times. This authority considers the general relations of neutrals and belligerents, and concludes that the well-established principles of internationl law are perfectly applicable to the case. He concludes as follows: "Telegraphic communication with the outside world may well be as important to a state engaged in warfare as similar means of communication between one point and another within its own territory. Just as an invader would, without scruple, interrupt messages, and even destroy telegraphic plant, on land, so may he thus act within the enemy's territorial waters, or, perhaps, even so far from shore as he could reasonably place a blockading squadron. It may be objected that a belligerent has no right to prevent the access of neutral ships to unblockaded portions of the enemy's coast on the ground that by carrying diplomatic agents or dispatches they are keeping up the communications of his enemy with neutral governments. But this indulgence rests on the presumption that such official communications are "innocent," a presumption obviously inapplicable to telegraphic messages indiscriminately received in the course of business. It would seem, therefore, to be as reasonable as it is in accordance with analogy that a belligerent should be allowed, within the territorial waters of his enemy, to cut a cable, even though it may be neutral property, of which the terminus ad quem is enemy's territory, subject only to a liability to indemnify the neutral owners. The cutting elsewhere than in the enemy's waters, of a cable connecting enemy with neutral territory, receives no countenance from international law. Still less permissible would be the cutting of a cable connecting two neutral ports, although messages may pass through it which, by previous and subsequent stages of transmission, may be useful to the enemy." It is always to be remembered, however, as Professor Holland observes, that international law is "no cut-and-dried system, but a body of rules founded upon, and moving with the public opinion of nations."

Effect on the Copper Market.—It happens that the United States and Spain are the two principal copper-producing countries of the world, and it is therefore possible that the war may have an effect on the price of this important metal. For the last few years the demand for copper has been brisk and the price has been stiffly maintained. In the United States the average price during the year 1897 was over 11 cents a pound. The production was 510,190,719 pounds, or 227,764 long tons. This is considerably over half of the entire production of the world, which, for 1897, is fixed at 396,723 tons by a competent English authority. The stocks on hand are said to be low all over the world, and an English contemporary thinks that a copper famine "is quite within the bounds of possibility." Considering the extent and location of the American sources of supply alone, it does not seem possible that the fear of an actual copper famine is well founded. However, a further advance in price, if the war should be of considerable duration, is possible, owing to the real or apprehended shrinkage of the foreign output.

Cable-cutting.—A dispatch from Washington on June 8th said: "It was positively established to day that the French cable running from Santiago to Cape Haytien went out of service last Friday and remained out of working condition until Saturday. During the 24 hours' interruption the cable company was unable to carry any business over this line. There is little doubt the interruption was due to the work of the cable-cutting ship sent out by General Greely and in charge of signal-service officers. The French cable began working again Saturday. How this came about is beyond explanation by the best cable experts. The French Cable company is said to be as much in the dark on this point as are the authorities here. All that the company knows is that it could not do business from June 3d to June 4th. The matter is further complicated by reports that the cable again stopped working at midnight Monday. The condition of this cable is regarded as important, as it is one of the means open to General Blanco in his communication with the Spanish authorities."

Cable Restrictions.—It is now claimed, but with doubtful authenticity, that the remaining cable from Santiago to Jamaica and the Haytian cable have been cut, and that Cuba is actually cut off from telegraphic communication with the rest of the world.

Miscellaneous Notes.—The war-revenue bill, as it passed the Senate, contained for stamp taxes on telegraph dispatches and a certain class of telephone messages. Each telegraph dispatch is taxed one cent, and each pay-telephone message costing 15 cents or over is also taxed one cent.

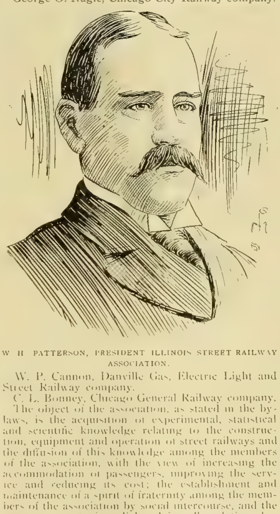
A Washington dispatch of June 9th states that General A. W. Greely, chief signal officer, has issued a general order to the cable companies directing that hereafter no news concerning the movements of American vessels or of American troops shall be sent to foreign countries. The order cover both press cablegrams and private messages.

Ensign B. R. T. Collins, formerly of the Chicago Edison company, has been assigned to the Scorpion.

Illinois Street Railway Association.

The second annual meeting of the Illinois Street Railway association was held at the Great Northern Hotel, Chicago, on June 7th and 8th. Among the representatives of street-railway companies in attendance were the following-named gentlemen:

D. A. Belden, Aurora Street Railway company.
J. F. Porter, Alton Railway and Illuminating company.
J. A. Day, Belleville Electric Railway company.
W. H. Patterson, Bloomington City Railway company.
B. F. Harris, Jr., Urbana and Champaign Electric Street Railway company.
E. X. Lesseure, Danville Gas, Electric Light and Street Railway company.
W. L. Ferguson, Decatur City Electric Railway company.
D. B. Sherwood, Elgin City Railway company.
N. B. McKinley, Joliet Railway company.
C. H. Cobb, Kankakee Electric Railway company.
W. H. Patterson, Lincoln Electric Street Railway company.
W. F. Sloan, Calumet Electric Railway company.
Walter Barker, Peoria Central Railway company.
R. N. Baylies, Rockford City Street Railway company.
J. F. Lardener, Rock Island Tri-city Street Railway company.
C. K. Minary, Springfield Consolidated Railway company.
F. O. Rusling, Waukegan Street Railway company.
W. F. Brennan, Chicago General Railway company.
E. D. DuBois, South Chicago City Railway company.
George O. Nagle, Chicago City Railway company.



W. H. PATTERSON, PRESIDENT ILLINOIS STREET RAILWAY ASSOCIATION.

W. P. Cannon, Danville Gas, Electric Light and Street Railway company.
C. L. Bonney, Chicago General Railway company.

The object of the association, as stated in the by-laws, is the acquisition of experimental, statistical and scientific knowledge relating to the construction, equipment and operation of street railways and the diffusion of this knowledge among the members of the association, with the view of increasing the accommodation of passengers, improving the service and reducing its cost; the establishment and maintenance of a spirit of fraternity among the members of the association by social intercourse, and the encouragement of cordial and friendly relations between the roads and the public.

The principal business of the first day's session was the election of officers for the ensuing year. The following-named gentlemen were chosen:

President, W. H. Patterson.
Vice-president, D. B. Sherwood.
Secretary and treasurer, C. K. Minary.
Executive committee, W. H. Patterson, D. B. Sherwood, C. K. Minary, B. F. Harris, Jr., Walter Barker, W. P. Cannon, D. A. Belden.

The principal feature of the second day's meeting was the address by Charles L. Bonney, president of the Chicago General Railway company, upon the "Rights of Street Railways Under the Constitution." The speaker complained of the tendency toward municipal control of street railway companies and declared most of the schemes now advocated unconstitutional. He suggested as a means of evading municipal interference in such cities as Chicago, a resort to the federal protection:

Under present legislation new companies may be formed under the Steam Railroad Act, and as such are authorized to lease any of the old lines built under the Horse and Dummy Act, and, as such, are also authorized to convey persons and property by "animals or by any mechanical power." Such companies can then connect with other companies by lease or operating contract, can extend across county or state boundaries, and can organize an interstate and United States mail business. It is certain that as such lines extend outside of the municipal limits they become outside of the municipal control. Such companies would then pass under the jurisdiction of the state and federal railroad commissioners. These advantages are now at the exclusive option of the companies and cannot be interfered with by the municipalities. The provision of the Illinois constitution requiring the consent of the municipality is expressly limited to a "street" railway, and not a railway in the street; therefore it may not possibly apply to general railroads. If a steam railway company may operate its road with "animals or any mechanical power," why should we not prefer to become general railroads, operated by trolley, rather than "street" railways operated by trolley? Whatever the judicial distinction may be, it may worry the cities, but not the companies. We will adopt our choice, and let the other fellow do the walking.

"The Operation of Street Railways in Small Cities" was considered by E. X. Lesseure, general manager of the Danville Gas, Electric Light and Street Railway company. Care and attention to detail were essential, he said, and the best material was the cheapest. D. B. Ferguson of Decatur followed with a paper on "Tickets, Transfers and Checking Conductors."

A. E. Lang of the Toledo Traction company, president of the American Street Railway association, was present at the meeting. He spoke on the street-railway situation in Toledo, and the causes which brought it about.

The next meeting will be held at Springfield in September.

The accompanying portrait of President Patterson of Bloomington was made from a sketch drawn for the Chicago Inter-Ocean, and kindly loaned for this occasion.

Statistics of Mineral Production.

The statistics of the mineral industry of the United States, gathered with great care and thoroughness each year by Mr. R. P. Rothwell, the editor of the Engineering and Mining Journal, are very valuable. They are published at length in the successive volumes of "The Mineral Industry," that for 1897—Vol. VI.—being now in press. Advance sheets show that the mineral and metal production of the United States in 1897 was the largest in the history of this or any other country; it almost equals in value the mineral production of all Europe. The book shows that the United States is rapidly attaining the point where it will be the greatest exporter of minerals and metals of all the commercial nations. The total value of the mineral production of the United States in 1897, after making all deductions, is fixed at $678,966,644.

A comparative study of the mineral production of 1896 and 1897 reveals many interesting facts. Aluminum shows an increase of from 1,300,000 pounds to 4,000,000 pounds, the respective valuations being $520,000 and $1,400,000. The increase was due partly to the reduction in price for the metal and partly to the development of a greatly increased export trade. The increase in the production of copper was from 479,806,183 pounds in 1896 to 510,190,719 pounds in 1897, and came chiefly from the mines of Arizona and Montana. A somewhat higher price was realized, and the total value of the '97 output of copper was $56,325,055, being exceeded, among all metal products, only by iron and gold. The small production of platinum—obtained in this country as a by-product of gold refining—remained stationary. Zinc production jumped from 77,637 to 100,387 tons, and in value from $6,117,796 to $8,271,889.

Among non-metallic substances calcium carbide increased from 860 ($48,000) to 1,925 tons ($134,750). There were four works engaged in the production in 1897. A considerable part of the output was exported. The production of crystalline graphite, practically all of it from Ticonderoga, N. Y., increased from 405,006 pounds ($18,225) to 993,138 pounds ($44,691). The output of amorphous graphite, all of it from Rhode Island, increased from 574 tons ($3,850) to 1,200 tons ($11,400). The production of ground mica increased from 570 tons ($9,887) in 1896 to 2,692 tons ($38,218) in 1897. The output of sheet mica increased from 17,630 pounds ($12,528) to 92,335 pounds ($45,615). The output of both ground and sheet mica was obtained chiefly from New Hampshire and North Carolina. New Hampshire produced the most ground mica, and North Carolina the most sheet. The value of the sulphuric acid produced in the country largely increased, reaching the sum of $21,446,079 last year.

A Muskrat's Exploit.

A little muskrat caused more trouble in Buffalo the other night than is ever known to have been caused by one of the animals. This particular muskrat succeeded in cutting off the electric-light supply of nearly the entire city, and it was an hour befo e the cause of the trouble was located and removed. With the exception of an isolated district, here and there, the entire town was wrapped in total darkness. Main street was one long avenue of gloom, broken only by lights in windows by private plants. Everything had been running smoothly at the power station of the Buffalo General Electric company when the startling discovery was made that the water in the boilers and condensers was rapidly going down. An examination of the valve that lets the water in through the big feed pipe that runs out into Buffalo River was made, but the valve was open as it should be. The valves on the boilers and condensers were examined, and they were found to be all right, too. The water in the boilers dropped lower and lower, until, finally, in order to avoid an explosion, it was found necessary to bank the fires and shut off the drafts. This done, the dynamos no longer supplied current for the lamps, and the lights went out. The trouble man was called to the station. He quickly located the trouble in the feed pipe. It was cut, and, after some fishing around, he dragged a muskrat out of the pipe and dropped it on the floor.

DEVELOPMENT OF THE TELEPHONE FIELD.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

Manager Robinson has completed the telephone exchange at St. James, Minn., giving the place local and toll-line service.

Emmett Warren, a lineman for the telephone company at Cherokee, Ia., received a severe shock while working in the office. His hand was badly burned and he was rendered unconscious for some time.

The Wayne County Telephone company held its annual meeting in Allerton, Ia., and voted to connect with the Sullivan and Porter telephone lines and give toll connection without extra charge.

The Iowa Telephone company will have new quarters in the J. W. Bopp block in West Union, Ia.

Materials are at Indianola, Ia., for the construction of the Mutual Telephone company's exchange, and work is to be begun at once.

The Standard Telephone company has begun building an exchange at Cresco, Ia.

It is believed that the Northwestern Telephone Exchange company will change its system at Little Falls, Minn., from automatic to a central office. The company offered to make the change if the subscribers could be increased to 60. The best that could be done was 54, but the indications are that the company will begin work soon to make the change.

The Wisconsin Valley Telephone company has offered to connect with the local exchange being built at Marshfield, Wis.

The Cedar Valley Telephone company will establish an exchange at Traer, Ia., and one at Dysart. Connection will be made with Elberon also.

The Iowa Telephone company has made the Anamosa, Ia., exchange a night-service office.

The Dwelle Telephone company of Lake City, Minn., has purchased a controlling interest in the Plainview Telephone company of Plainview, Minn., the change occurring June 1st. Improvements will be made to the system.

Aberdeen, S. D., is connected with Ipswich, S. D., over the lines of the Dakota Central Telephone company, the line being completed lately.

The Board of County Commissioners of Wells county, N. D., has granted the North Dakota Telephone and Electric company of Harvey, N. D., a franchise through the county.

Oshkosh, Wis., has connection with Berlin, Wis., over the lines of the Little Wolf River Telephone company, which have just been extended to Oshkosh. The new line is to be extended to Winneconne, Larson, Neenah and Menasha.

The Iowa Telephone company will install an exchange at Logan, Ia.

The Board of Public Works and the Northwestern Telephone Exchange company in St. Paul are having a difference of opinion as to whether the company ought to remove its poles from Marshall avenue, as ordered to be done by June 1st. The company asks for an extension of six months, but refuses to give a promise that the poles will be removed in that time. The board will give the company another chance to make an agreement as to the time, and if it fails to do so will recommend that the City Council have the legal department of the city proceed to compel the removal.

Judge Amidon of the United States Court has held that Lake street, in Minneapolis, and all streets over which mail is delivered, are post roads, and, as such, the Northwestern Telephone Exchange company has the right to string wires, subject alone to the police regulations of the municipality. The decision holds that every street in the United States over which mail is distributed is a post road. He also held that, if the council had, in revoking permission to set poles on Lake street, given permission to set them on a parallel street, the telephone company would have had no case. The city loses, but it can force things to an uncomfortable end for the company, for, under the decision, the wires can be ordered underground all over the city, and the company put to the expense of placing them in conduits immediately after getting them on the poles. Notice has been given in the Minneapolis Council that an ordinance requiring the wires on Lake street to be put underground will be introduced soon. The city attorney thinks that an appeal would change the decision, so far as holding every street to be a post road on which mail is distributed, but thinks that with the power to order wires underground all over the city the appeal is unnecessary.

H. G. Webster, who has been manager of the Northwestern Telephone Exchange company's office at Grand Forks, N. D., for the past five years, has been promoted to assistant superintendent of the Minneapolis exchange. He is succeeded at Grand Forks by R. G. Fahnestock, from St. Cloud, Minn.

Efforts are being made to sell stock in a telephone concern which proposes to build a line from St. Paul to Hastings, Minn.

The Iowa Telephone company has put up 15 private lines in Elkader, Iowa.

E. T. Dufur has bought the Lorimor and Macksburg, Ia., telephone line and is rebuilding it.

The Standard Telephone company has reduced rates for its service in Decorah, Ia. There are 200 instruments in use in that city.

The city of Woodbine, Ia., has granted a franchise to the Iowa Telephone company.

The Cedar Valley Telephone company has completed connections with the important lines of Tama county, Ia., including Tama City, Traer and Toledo.

The Rocky Mountain Bell Telephone company has begun extending a line from Parrott, Mont., to Dillon and Virginia City, and to Twin Bridges. A line will be built at once from Missoula to Coeur d' Alene, Idaho, and another line is in progress to Baker City, Oregon, from Boise, Idaho.

George Horn & Co. of Adell, Wis., will build a line to connect Silver Creek, Random Lake and Adell.

The Village Council of River Falls, Wis., has revoked the old franchise of the Pierce County Telephone company and granted a new one with new conditions.

The Iowa Telephone company is stringing two new wires between Muscatine, Ia., and Oskaloosa.

The Iowa Telephone company will be granted entrance to Ira, Ia.

Percy Hoyt has been appointed inspector of instruments for the Sunset Telephone company at Seattle, Wash.

The Fergus Telephone company has been incorporated at Fergus Falls, Minn., with $15,000 capital stock. G. Barrows, Robert Hannah, E. A. Jewett, W. L. Parsons, all of Fergus Falls, and W. H. Davy of Moorhead, Minn., are the incorporators.

The Mutual Telephone company of Cedar Rapids, Ia., is constructing a new cable to the West Side.

The Wisconsin Telephone company is an applicant for entrance to Chilton, Wis.

J. F. Cass, president of the Western Electric Telephone company, was in Minneapolis recently. In an interview, he said that the new telephone company would surely install an exchange in the city, and that competition was as good for telephone business as for anything else. The Minnesota Central Telephone company's long-distance lines have reached the city limits.

W. T. Sparks is installing a telephone system for Lodi, Wis.

The Minnesota Central Telephone company will soon have the local exchange for Glenwood, Minn., completed and in operation. The long-distance connection is expected to be completed soon.

The Board of Aldermen of St. Paul voted to return the $5,000 cash deposit of the Mississippi Valley Telephone company.

Telephone connection has been completed between Elbow Lake, Minn., and Herman.

The Northwestern Telephone Exchange company has appealed from the award of the commissioners allowing damages for a right-of-way between Mankato, Minn., and Lake Crystal, alleging it to be "grossly excessive."

Extensions and Improvements.

A new telephone line will be built by John N. P. Insley from Salisbury, Md., to Quantico and Nanticoke Point, connecting at White Haven with the line from Princess Anne.

The Chester County Telegraph and Telephone company is arranging to extend its line from West Chester, Pa., to Oxford, through Kennett Square, Avondale and West Grove.

The Bell Telephone company has commenced work on a new exchange in the city of Quebec. The structure will be built of granite and will cost upwards of $20,000. The switchboard will accommodate 3,000 subscribers.

Progress with the erection of poles and wires for the States telephone exchange at Guernsey, England, has so far advanced that it is expected that the exchange will be open for business this month. The switchboards are being especially made for the Guernsey exchange, and comprise several novel devices designed to save labor, facilitate rapidity in making connections and reduce the chance of error. The first circuits completed will be St. Peter-Port, St. Sampson's and the Catel, including several subscribers at Cobo. St. Andrew's and St. Martin's will be joined up a month or so later, and switchrooms at the Vale, at the Forest and St. Peter-in-the-Wood will be opened as soon as the necessary number of subscribers present themselves. When all the circuits are opened there will be between 300 and 400 subscribers, which, according to the London Electrical Engineer, is a good number for a start.

Central Energy Telephone System.

The accompanying cut illustrates the type of subscribers' telephone for the central-ringing energy and local talking-battery system of the Stromberg-Carlson Telephone Manufacturing company, Chicago.

This instrument is the same as type "Z," but with battery-box for the local battery. In this system the regular exchange equipment can be used in part. It also requires full metallic construction.

In the Stromberg-Carlson central-energy telephone system all the parts subject to deterioration and wear are placed at the central office, leaving nothing at subscribers' stations requiring attention and reducing cost of maintenance to practically nothing. It is convenient, durable, economical and is claimed to be the only system of its kind on the market. The transmitter and receiver not being effected by the greatest variations in temperature or atmospheric changes, and being locked to prevent all opening by inexperienced persons, leaves no possible cause for readjustment. They are said to be the only instruments that can be used satisfactorily in such systems.

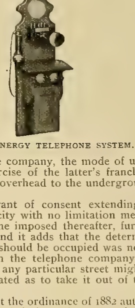
Telephone Wires in City Streets.

By an ordinance of December 24, 1879, the Bell Telephone company was "authorized to run and maintain its wires over and through the streets of the city of Philadelphia for the purpose of establishing telephonic communication between its patrons and between its exchange office and the subscribers thereto." Except certain preliminaries, which were complied with, the only condition imposed by this ordinance was that the company should enter into a written obligation to comply with all the ordinances, then existing or thereafter passed, 'regulating or in any manner controlling telegraph or telephone companies in the use of the streets for telegraph and telephone purposes."

The Bell Telephone company having accepted this obligation, and constructed its lines, the Supreme Court of Pennsylvania says that it is clear that the power of the city to impose conditions upon its grant of consent was ended. Its authority thereafter was only that of regulation as to the use of the streets.

But the grant of authority to run and maintain wires "over and through" the streets, the court holds, did not include permission to lay them under, below, or beneath. "Over" and "through," it says, are equivalent to "across" and "along," not only by the natural meaning of the words in this connection, but by the practical construction given to them at the time by the acts of the parties.

When, however, in June, 1882, the city directed the removal of all poles and wires, except its own, from the streets prior to January, 1885, and prohibited the erection of any others after that date, and the telephone company raised no question as to the reasonableness of this ordinance as a regulation of the use of the streets, but proceeded to construct and put into operation, in a considerable part of the city, its underground conduits and wires, the Supreme Court holds that, by the concurrent act of the city and the company, the mode of using the streets in the exercise of the latter's franchise was changed from the overhead to the underground system.



CENTRAL ENERGY TELEPHONE SYSTEM.

The original grant of consent extending to all the streets of the city with no limitation means that there could be none imposed thereafter, further declares the court, and it adds that the determination as to what streets should be occupied was no longer in councils, but in the telephone company, except possibly, so far as any particular street might be so exceptionably situated as to take it out of the general rule.

Moreover, in that the ordinance of 1882 authorized, and in fact commanded the replacement of the overhead by the underground system, the court holds that, in so doing, it necessarily authorized the construction of conduits, terminal poles, or any such appliances as are or may be reasonably necessary to make the system effective.

And the authority to regulate the manner of occupation of the streets, which the city retained, the court holds, included the power to compel the adoption from time to time of all reasonable and generally accepted improvements which tend to decrease the obstruction of the streets, or increase the safety or convenience of the public in their use. And the use of terminal poles being the system theretofor adopted, the court holds that the burden of showing that there was a better one in general acceptance and reasonably adoptable by the telephone company would be upon the city.

International Telephony.

The Elektrotechnische Zeitschrift says that a new metallic-circuit telephone line is about to be built between Paris and Brussels, and that the Belgian government is negotiating with the German government to secure a connection between this new line and the Brussels-Cologne and Cologne-Berlin lines. This would put Berlin and Paris in telephonic communication. If the electrical constants of the new Paris-Brussels line are to be such that speaking is possible to Berlin, it should also be possible to use it for regular service between London and Brussels via Paris, and perhaps between London and parts of Germany also. It is said, however, that the present London-Paris cables are continuously in use during the greater part of the day, so that no extensions are likely to be contemplated at present.

Death of Judge Grinnell.

Julius S. Grinnell, general counsel for the Chicago City Railway company, died suddenly in the Illinois Trust and Savings Bank, Chicago, on Wednesday, June 8th. Mr. Grinnell was attending a business conference with the bank officials on behalf of the Chicago City Railway company when he experienced an attack of heart trouble which resulted fatally almost immediately.

Judge Grinnell, as he was commonly termed, on account of the position he occupied before he became general counsel for the railway company, was an able lawyer and an experienced man of affairs, and he possessed the confidence of the community to a degree that few men command. He had a distinguished record as state's attorney and judge in Chicago before entering the service of the street-railway company, having conducted many famous criminal prosecutions successfully. Among these were the trial of the anarchists and the almost equally famous boodle and ballot-box-stuffing cases, in all of which he secured convictions of the offenders.

His record as a corporation lawyer was equally good, and he was considered an authority on the law governing street-railway properties. Personally he was of an engaging disposition and was one of the most popular officials of the street-railway company. He was ever mindful of the interests of others, and his treatment of his associates, especially young lawyers, won many friends.

Mr. Grinnell traced his ancestry through a long line of Americans, Welsh and French to the town

JULIUS S. GRINNELL.

of Grinnelle, in France, just within the fortifications of Paris. His father was Dr. J. H. Grinnell of New Haven, Vt., where Mr. Grinnell spent his boyhood. He was a graduate of Potsdam Academy, St. Lawrence county, N. Y., and of Middlebury (Vt.) College. He studied law in the office of William C. Brown of Ogdensburg.

Mr. Grinnell was married in 1869 to Miss Augusta Hitchcock, daughter of Dr. William H. Hitchcock of Shoreham, Vt. There are two children, Robert, a student at the University of Michigan, and Bertha, who is at school in Chicago.

Mr. Grinnell was a member of the Chicago, Union League, Iroquois and Chicago Athletic clubs, and of Apollo Commandery, K. T., and Consistory.

Convention News and Gossip.

[*Continued from page 345.*]

the five stations erected by his company, beginning in 1888. Lately the company has concentrated its steam generating plant in a new condensing station on the river, with single-phase and three-phase generators, operating the old plants as sub-stations and using the direct current, three wire, low-tension system of distribution, in a way very similar to the plan of the Chicago Edison company.

One of the older members of the association commented on the great change in the membership that had taken place since the last Chicago convention, that of 1889. The nine years intervening have witnessed a tremendous development in the electrical industries, accompanied by a solidifying and shaking-down process. The electric-lighting business was in the heyday of the "boom" period nine years ago, now it is approximating the stage of a well-established industry, with settled and recognized standards. Some illusions have been dispelled, and the manufacturers of electricity have a truer conception of the business in which they are engaged. There are fewer electrical enthusiasts, but many more practical electrical business men and trained engineers. The change in the method of conducting the business has brought changes in personnel and has almost revolutionized the atmosphere of the annual (then semi-annual) meetings. Comparatively few of the men active in the '89 convention were present in the gathering of this week. Those who have remained are men with the clearness of perception and the resource to adapt themselves to changing conditions.

By an interesting coincidence, the opening day of the meeting was a dark day, and this gave the first real opportunity to test the large storage battery of the Chicago Edison company in actual service. The next day was that consumed in the important debate on the relative value of alternating and direct currents for general distribution from central stations. Of course, in this discussion the use of the storage battery was bound to enter, and both the alternating and direct-current champions devoted considerable attention to it at the morning session. The latter, General Superintendent Ferguson of the Chicago Edison company, was quick to seize upon the opportunity afforded by Tuesday's experience, and when the discussion was resumed in the afternoon of Wednesday he was ready with a chart showing the load curve of the previous day. The efficient service rendered by the battery on Tuesday forenoon in taking a large share of the sudden and abnormal load, when the storm came up, was graphically shown to all present, and much weight was carried by Mr. Ferguson's declaration that the storage battery (which can be used, of course, only with direct current) was a useful auxiliary. It was a quick and enterprising bit of work, and it was effective.

Exhibitors and Visitors.

A. W. Watriss was on hand to push things for Charles A. Schieren & Co.

Richard O'Connor represented the National Carbon company of Cleveland.

Channing T. Gage represented Washburn & Moen and was constantly to the front.

George W. Conover, specialist in the Monadnock block, was "right there" all the time.

Manager Kuhlman of Elkhart, Ind., kept the Kuhlman Electric company before the delegates.

Messrs. McGill and Pomeroy were in attendance and were warmly greeted by many friends.

W. S. Hine and E. L. Barr of the Wallace Electric company were in constant attendance.

Charles G. Armstrong, the Chicago electrical engineer, mingled with the throng in the rotunda.

G. E. Varney of Varney & McOuat, electrical specialists of Indianapolis, mingled with the boys.

Manager L. H. Rogers of the Fort Wayne Lamp company stayed the full three days with the boys.

The Cutler-Hammer Manufacturing company was in evidence in the person of General Manager Cutler.

President Morgan Brooks of the Electrical Engineering company, Minneapolis, arrived Wednesday morning.

Secretary and Manager W. D. Packard of the New York and Ohio company of Warren, Ohio, was on hand.

Mr. Swingley of the Chicago Armature company was, of course, on hand, and very ably represented his company.

There was one man that was greatly missed. S. M. Hamill should have been at the convention. Why wasn't he there?

President Marsh of the Bryan-Marsh company presented the merits of his company in company with Western Manager Hill.

A. G. Zamel of the Zamel Arc Light Meter company of 266 Blue Island avenue, Chicago, mingled with the assembled delegates.

Roth Bros. & Co., Chicago, were, of course, "in it," and consequently their dynamos and motors came in for a good deal of attention.

Manager Norman Marshall of the Anchor Electric company, in company with Western Manager C. O. Baker, was on deck at all hours.

Popular George J. Jackson, the man of national reputation, was there, too, on behalf of the National Conduit and Cable company of New York.

There was never a convention that did not see the face of J. S. Crider, secretary of the Washington Carbon company, and this time was no exception.

The Triumph Electric company of Cincinnati had able representatives at the convention to remind the delegates that Triumph apparatus was still at the front.

John Child, representing A. O. Schoonmaker, is now said to be one of the "smoothest." "Child's nerve was with him," some one said, as he gazed at that piece of mica 14½ by 32 inches that hung just over the main stairway from the rotunda to the parlor.

It was a matter of great regret that General Manager J. S. Speer of the Partridge Carbon company did not appear at the convention. Where was Partridge?

K. McLennan & Co., representing Gale's commutator compound, flooded the convention with their circulars, but Manager Isaacs was among the missed.

F. A. Wunder of the Fort Wayne Electric corporation, Fort Wayne, Ind., bobbed up, bringing along with him that smile that has sold hundreds of machines.

The Swarts Metal Roofing company, Chicago, was represented by Seymour Swarts, president, who was cordially received by many of his customers at the convention.

The Auditorium Hotel management deserves great credit for the ease with which the throng was handled. Many were the words of praise for Manager Southgate.

Manager Charles Holmes, of the supply department of the Chicago Edison company, was indefatigable in his efforts in adding to the pleasure of all visiting delegates.

Secretary and Manager Edmund Dickey of the American Carbon company of Noblesville, Ind., was accompanied by A. T. Webb, appearing on Thursday at the Auditorium.

Godfrey Luthy of the Royal Electric company made the trip from Peoria in company with Electrical Engineer Scheeffer. Mr. Luthy is popular and always welcome.

General Manager Smith of the Chicago Insulated Wire company mingled with the guests in the rotunda. Mr. Smith is now a regular attendant at electric-light conventions.

J. C. Wormley seized the occasion not only to push his incandescent-lamp business, but to remind people in general that the "La Marquette" lamp is the lamp for bicycles.

Manager Hickcox of the American Rheostat company was at the Auditorium on Wednesday. Mr. Hickcox will soon make an interesting announcement to the electrical trade.

George S. Searing, the man who sells Hart switches in Chicago, was a visitor and a very popular one. Mr. Searing is gifted with a personality that makes and retains him friends.

R. E. Lucas, the genial secretary of the Indiana Rubber and Insulated Wire company of Jonesboro, Ind., was on hand. Paranite wires, manufactured by this concern, are in greater demand than ever before.

The inimitable Charles D. Shain of New York was one of the first to arrive. In fact, he appeared even before the New York delegation. Mr. Shain stayed during the convention, and met many of his Chicago friends.

A man never absent from conventions is J. R. Wiley, manager of the western sales department of the Standard Underground Cable company. Mr. Wiley was accompanied by his sisters, Mrs. Patterson and Miss Wiley.

The Northern Electrical Manufacturing company of Madison, Wis., was well represented in the person of G. A. Edward Kohler. Kohler Bros., it will be remembered, were recently appointed agents for the Northern company.

The Sawyer-Man Electric company had an interesting exhibit of incandescent lamps at the Westinghouse headquarters, and was capably represented by Messrs. F. H. Smith, manager, of Pittsburg, and C. A. Ross of Chicago.

Sears B. Condit, Jr., manager of L. A. Chase & Co., came from Boston to mingle with his many western customers. Mr. Condit is a true Bostonian, and believes in the Hub, but he has made many warm friends through his courtesy.

"Charlie" Jenney of the Jenney Electrical Manufacturing company of Indianapolis arrived on Wednesday. Mr. Jenney is rebuilding the old burnt-out Jenney factory, with every prospect before him of a most successful business.

The firm of Meysenburg & Badt was represented by F. B. Badt, O. W. Meysenburg, William Goltz and R. F. Schuchardt. It is safe to say that the convention resulted beneficially to this firm, with so efficient a staff to represent it.

General Manager James I. Ayer of the American Electric Heating corporation of Cambridgeport, Mass., was one of the first to arrive. Mr. Ayer's appearance at a convention always recalls his memorable convention at St. Louis.

Mr. Arthur Warren, who has recently assumed the management of the advertising department of the Westinghouse Electric and Manufacturing company, came early and stayed late. Mr. Warren is a courteous gentleman, whose pleasant personality adds to his recognized skill as a handler of that difficult problem, advertising. Mr. Warren has this exten- [illegible]

department entirely in his charge, and his work stamps him as one of the foremost electrical advertising men in the United States.

The Varley Duplex Magnet company was, is usual, skillfully represented by Mr. Knox. Mr. Knox is now located in the office of the Central Electric company, looking carefully after this branch of that large institution's prosperous business.

Mr. M. B. Austin of M. B. Austin & Co. was on hand with that smile that has done so much for Safety insulated wire, especially in the West. Mr. Austin has recently taken in a partner to share the glory of a rapidly growing business.

Popular Colonel Shay did the honors for the Charles Munson Belting company. Colonel Shay has a quiet way of insinuating himself into the affections of electric-light men, and it is said on this occasion he "booked" quite a number.

S. F. B. Morse was, of course, on hand, for what would a convention be without Morse? Mrs. Morse was also one of the coaching party of Tuesday and joined with the other Chicago ladies in extending greetings to the ladies from out of town.

Where was Charlie Newton of the Eddy company? Baird was there, and somebody said this latter gentleman was disconsolate for his "better half." Mr. Newton has been a constant attendant at all conventions, and he must never make excuse again.

The genial secretary of the Phillips Insulated Wire company, Henry C. Adams, Jr., of Pawtucket, R. I., was on hand too. Mr. Adams had no exhibit, but his unfailing courtesy was of as much benefit as an exhibit of cold facts would have been.

The Electric Appliance company was in full feather, as is evidenced by the following list of representatives, who did the honors: Thomas I. Stacey, W. W. Low, Messrs. Millard, Towner, C. J. Wells, B. B. Downes, Perry Boole and William Stacey.

The Fort Wayne Electric corporation was represented by Messrs. Charles Munson of the Chicago office, C. E. Wilson of Philadelphia, Kirkpatrick of Grand Rapids, R. E. Stearns of New Orleans, Willard Knight, Geiger and Frank A. Wunder of New York.

President John C. Boss of the Lakon company, the well-known manufacturer of transformers at Elkhart, Ind., was one of the most popular men in attendance. Mr. Boss is one of the leading men of Elkhart and has a host of friends. Mr. Boss was accompanied by G. Mahony.

General Manager T. S. Lane of the Electrical Exchange, in company with H. H. Hornsby, did the honors for the Electrical Exchange. The Electrical Exchange has made a host of friends, and many are the kind remarks heard relative to Mr. Lane's enterprise and "hustling" proclivities.

One of the most popular of the supply representatives at the convention was Western Manager J. C. Shainwald of P. & B. paint fame. There were many inquiries for Mr. DeRonde, who has, indeed, "gone to the war." He was very much missed, as DeRonde and Shainwald make a pair hard to beat.

George Whyte of the Leschen-Macomber-Whyte company distributed a neat little booklet. Mr. Whyte was accompanied at the Monday night reception by Mrs. Whyte. It is safe to say that no two people will be more welcome at coming conventions than Mr. and Mrs. George Whyte.

Bernard Hartley, manager of the Hartley Electrical works, Chicago, was on hand during the convention and took advantage of the opportunity to renew old acquaintances. Mr. Hartley is an old Westinghouse man, and besides securing a number of orders, spent a pleasant time with many of his old associates.

Col. G. A. Hurd did the honors for the Crane company, Chicago. Colonel Hurd is now actively engaged in patriotic work in the organization of Hurd's Volunteer Regiment. Mr. Hurd is an old military man, and his fighting qualities show not only in his military work, but in his business as well.

Irving Rouse Prentiss, to give him all the names he is entitled to, of the General Electric company's lighting department at Philadelphia, was, as usual, everywhere, and did most excellent work for his company. Mr Prentiss is an old Brush man and one of the best posted arc-light salesman in the business.

The Garton-Daniel Electric company was one of the three companies whose interests were looked after by Mr. W. R. Garton. This company's lightning arrester has now become one of the standards, and its success is well deserved as it is said to be one of the most efficient devices of this kind on the market.

The Jandus Electric company of Cleveland, O., had the merit of its good ... represented through the attractive personalities of J. H. Cooke, western manager, and H. T. Edgar, manager for New England. Messrs. Cooke and Edgar were everywhere and at all times. The Jandus company had a telling card in the remarkable small consumption of carbon of the company's new lamp. Twenty-five carbons a year is all that this lamp requires, and when it is considered that the estimated cost of these is only 75 cents, it will be realized that Messrs. Cooke and Edgar had plenty to do. Mr. Cooke also looked after the interests of the Buckeye Electric company of Cleveland.

President W. N. Matthews of the St. Louis Electrical Supply company, St. Louis, arrived at the Auditorium on Wednesday morning. It was a matter of regret that Mr. Matthews could not have arrived sooner in order to have attended the reception and also to have done the honors for St. Louis in the coaching party.

H. J. Gille of St. Paul, Minn., formerly with the General Electric company, and recently with Washburn & Moen, was congratulated by his many friends on his recent appointment as general sperintendent of the electrical departments of the St. Paul Gas Light company and the Edison Electric Light and Power company.

The Crocker-Wheeler Electric company of New York made no exhibit, but was kept well to the front through the efforts of Western Manager C. H. Wilmerding, assisted by Julian Roe. Mr. Wilmerding earned the hearty thanks of the ladies at the reception on Monday night by his successful effort to make them all have a good time.

Secretary and Treasurer W. D. Hughes of the Central Manufacturing company of Chattanooga, Tenn., arrived in Chicago on Thursday, just in time to "be in at the death." Mr. Hughes is doing a prosperous business in electrical lumber, and Chattanooga, through him, is now looked upon as one of the centers for this branch of the business.

President and General Manager Henry B. Cutter of the Cutter Electrical and Manufacturing company, accompanied by Mrs. Cutter, was among the first to arrive, coming with the New York delegation. Mr. Cutter is one of the most constant attendants at conventions, and Mrs. Cutter this time made a most agreeable addition to the ladies' contingent.

Capt. Willard Candee and George T. Manson, as has been their time-honored custom for years, told the "old, old story" of Okonite. These gentlemen distributed among the warmest friends of Okonite a souvenir in the shape of a miniature of a beautiful girl, that may safely be said to be one of the handsomest, if not the handsomest, of the convention gifts.

"Val" and Clark were, of course, on hand, and took care of those pole men who were unwary enough to allow them to approach. Clark vowed and declared he had reformed, and would not attend conventions any more, but Thursday morning found him there bright and early. Valentine came, too, for it was said he could not be kept home except by a death in the family.

The American Electric Telephone company was not forgotten. Mr. P. C. Burns of the company did not lose this opportunity to "mix" with his host of old friends in the electric-light business. Mr. Burns, it will be remembered, was at one time one of St. Louis' most prominent supply men, and this opportunity proved a very pleasant one for him to renew old acquaintances.

J. Holt Gates, assisted by G. B. Foster and C. H. Philbrook, did the honors, and did them well, for the Walker company. Mr. Gates has during the last year built up a most flourishing business, and the fact that, in addition to his own time, his enterprise requires the services of two such active men as Messrs. Foster and Philbrook, speaks well for his popularity and enterprise.

J. W. Hull represented the Cabinet Manufacturing company of Steubenville, O. Mr. Hull has been actively engaged for some time pushing the business of his company, especially among the telephone manufacturers in the United States. His success has been remarkable, as is shown by his factory's present crowded condition. Mr. Hull is a man whose personality makes him a host of friends.

Manager Charles E. Coleman of Eugene Munsell & Co. and the Mica Insulator company, Chicago, appeared at the convention early Tuesday morning. Mr. Coleman had lots to do, as he is one of the most popular and hustling salesmen in his line in the West. Under his management his two companies' businesses have increased at a remarkable rate, and there is no one more deserving of success than Coleman.

President A. M. Searles and Electrical Engineer G. A. Scheeffer of the Diamond Electric company did most excellent work through the exhibition of their well-known Scheener meter. This device stood in a corner of the rotunda, and its careful and accurate workmanship were much admired. Mr Searles, one of the most experienced men in the electrical business, had his time fully occupied in meeting his friends.

Thomas R. Mercein of the Northwestern Electrical association came early and stayed late, and several new members were added to the already large list of the Northwestern Electrical association. The silver-tongued orator was on hand on every occasion, and he did splendid work on behalf of the association that is proud to call him secretary. Mr. Mercein's work at the National convention, however, was only the beginning, for he came prepared to look after the interests of his association on the trip to Duluth.

General Manager H. H. Brooks of the American Circular Loom company, assisted by the general western agent, George W. Patterson, did great work for his popular conduit. Mr. Brooks was warmly welcomed by a host of friends who were glad to see him after his long western trip. His souvenir, in the shape of a smoking outfit, was much sought after; in fact, it is said, that he had to hide a few for his best friends.

The ubiquitous Colonel S. G. Booker of the Phœnix Carbon Manufacturing company of St. Louis, was on hand during the entire time. Colonel Booker isan enterprising carbon man, who never lets the grass grow beneath his feet. His carbons have a national reputation, and his aggressive and enterprising methods have increased his company's business to such a point that an extension to his factory has been necessary.

President Schumacher of the Zamel Arc Light Meter company, Chicago, came nearly losing his reputation as one of the best of good fellows, by not turning up until late Wednesday afternoon, but he got there just the same. Mr. Schumacher has made a great success with the Zamel arc-light meter. This device records the number of hours of service of arc lamps, and is well worth the investigation of central-station men interested in economy.

George Cutter of the George Cutter company and his right-hand man, Albert Scheible, two "electrical specialists," were on hand accompanied by the usual supply of Cutter's "devils." Mr. Cutter is now pushing the business for which, so to speak, he is eminently designed, that is, the production of novel and useful electrical specialties, and his establishment at 100 Lake street, Chicago, places him in a position to carry out his heart's desire.

The Central Electric company, Chicago, was represented by President George A. McKinlock and Secretary C. E. Brown, to say nothing of Messrs. Burton, Upham and Cobb. The Central company made no exhibit, but its full force of indefatigable workers was on hand at all times at the Auditorium. Messrs. McKinlock and Brown attended the reception Monday night. The souvenir ash-tray distributed by the Central company was highly prized.

The Eddy Electric Manfacturing company was represented in the person of M. E. Baird. Mr. Baird was one of the first to come and the last to leave, and warmly was he welcomed. The business of the Eddy company has increased most rapidly during the last year, and the rapid progress made is due largely to Mr. Baird's indefatigable work. Mr. Baird is a hustler, and leaves no stone unturned in keeping Eddy machinery in the very front rank.

Until the last moment it was expected that Joseph Franklin and Manager of Sales Paul D. Cable would come up from St. Louis to do the honors for the Commercial Electrical Supply company. Some one whispered, however, that the large fan business they were doing in St. Louis prevented them from turning their faces northward. It was a matter of great regret that these two men could not have found the time to appear. They would have been warmly welcomed.

The Electric Storage Battery company appeared in the persons of Herbert Lloyd, Frank H. Clark, John P. Williams and Joseph Appleton. This company did not make an exhibit at the hotel, although it had a parlor at the Auditorium, where hospitality was dispensed. The Edison storage battery, however, was in reality an exhibit, and it attracted an immense amount of attention, due to the fact that it is one of the most remarkable exhibits of its kind in this country.

Manager G. O. Rockwood of the Rockwood Manufacturing company, Indianapolis, Ind., made a most interesting exhibit in one corner of the rotunda. Mr. Rockwood showed a device through which it was proved, by practical demonstration, that the Rockwood paper pulley had a much greater adhesion for a belt than a common iron pulley. It was noticed that the Japanese gentlemen who attended the convention were particularly interested in this device.

President Frank N. Phillips of the American Electrical Works, Providence, was in constant attendance, in company with Western Manager Frank Donohoe. It is not often that Mr. Phillips goes as far West as Chicago, and Mr. Donohoe royally did the honors. In fact, there is never a convention that Mr. Donohoe does not add to his laurels in this respect. Edgar H. Hammond, also of the western office of the American Electrical Works, joined forces with Mr. Donohoe during the last days of the convention.

President Frank E. Healy, Secretary Lemuel K. Cushing and Manager Carl Keith made their first appearance at a convention in the representation of the prosperous new Chicago electrical supply house, the Illinois Electric company. These men are of experience in the supply business, and thus far, from all reports, their venture has proved successful beyond their fondest expectations. This was to be expected, however, with young men of such

capabilities as these three members of the company are known to possess.

W. P. Sullivan of the Menominee Electrical and Mechanical company of Menominee did himself proud. In fact, it was said on all sides that the coaching party would not have been a success had not Mr. Sullivan held the reins of the leading coach, so to speak. Mr. Sullivan has represented the Menominee company for nearly a year, and through his large number of western friends has been able to greatly increase this concern's business. Mr. Sullivan is well liked, and this fact undoubtedly adds greatly to his business success.

General Manager Gilmer of the Warren Electric Specialty company, Warren, O., appeared on Wednesday. Mr. Gilmer is a peaceable-looking man, and one would hardly expect to find behind that genial and courteous bearing so much of the sternness that has brought his company so far to the front in its fight against the "lamp trust." Mr. Gilmer is now seeking a good name for his lamp. He believes it is rather to be chosen than great riches. In fact, his company is now offering a prize for a new name for his new lamp.

President J. B. Crouse of the Crouse-Tremaine Carbon company, also president of the Fostoria Incandescent Lamp company, was on hand during the convention. Mr. Crouse reports much success with his new lamp, and also states that the two institutions have recently appointed a Chicago representative in the person of J. W. Brooks. Mr. Brooks, until recently, was president of the Brooks-Follis Electric corporation of Chicago. He and Will Hereafter make Chicago his headquarters and attend to the interests of the two Fostoria companies.

Manager R. D. Allen, accompanied by the district sales agent, W. L. Arnold, was on hand taking care of the affairs of the Siemens & Halske company of America. Mr. Allen recently taken charge of the Siemens & Halske affairs, and the company is already feeling the effects of his aggressive and progressive policy. Mr. Arnold has only recently joined forces with the Siemens & Halske company, and it may be said that the addition will redound to the credit of the company's present aggressive policy. Mr. Arnold is one of the best known electric-light salesman in the country.

Secretary-treasurer and Manager R. H. Bouslog of the Peru Electric Manufacturing company, Peru, Ind., could not tear himself of the pleasant opportunity to meet in a social manner the many friends of the Peru company. Mr. Bouslog has recently gotten out a catalogue describing a number of novel electrical specialties and calls particular attention to the Peru patent fuse plug. This is a porcelain device that will undoubtedly have a large sale. In fact, there are a number of interesting specialties that will make this catalogue valuable to every man purchasing porcelain supplies.

To again refer to James Wolff of the New York Insulated Wire company as a prince of good fellows would be a well-worn repetition, but it seems necessary to use the familiar phrase. There is no doubt that Wolff of the New York Insulated Wire company and George Whyte of the Leschen-Macomber-Whyte company are two of the bright shining lights of electrical gatherings. It would take a book, though, to tell of their achievements, especially if coupled with the story of their wives. It is a matter of great regret that these two gentlemen were unable to attend the convention of the Northwestern Electrical association.

R. J. Randolph, the general manager of the sales department of the Sterling Arc Lamp company of New York, was on hand to secure for his company a most conspicuous and striking display parlor. What Mr. Randolph exhibited had the quality of delighting the eye as well as the palate. The Sterling enclosed arc lamp was decidedly on hand. The Sterling constant-potential, 110-volt lamp was shown, as was also a series 6.2 ampere, 65-volt lamp, and a series 9.5-ampere, 65-volt Sterling lamp. Mr. Randolph is known as a genial entertainer, who manages, so to speak, to present a bouquet to every prospective customer, and in this case he excelled himself.

A. W. Morrell, who has met with such success in the installation of the motor department for the Miller-Knoblock company of South Bend, Ind., seized the opportunity to run up and mingle with the delegates. Mr. Morrell is what might be termed a commutator specialist, and the Morrell commutator made by his improved hydraulic process is a marvel of accurate and solid work. Those interested in commutators and the prevention of their troubles should correspond with Mr. Morrell, especially those who have Western Electric machines, and are desirous of learning something about what Mr. Morrell claims as a most decided improvement on the standard type of commutator usually employed on that type of machine.

James B. Cummings, now perhaps better known as the "London Man," was on hand and did much missionary work in announcing the appearance of a new Cummings tubing. Mr. Cummings has recently organized the Cummings Electric Tube company of Detroit, and is now preparing to take contracts for the delivery of high-tension currents underground through the agency of his new tubing. Mr. Cummings claims that the new Cummings tube is cheaper than lead-covered cable. The specialty is well worth the investigation of those considering the installation of high-tension electrical machinery. Mr. Cummings also represented at the convention the Armorite Interior Conduit company of Pittsburg and also the Cummings Conduit company of Detroit.

The Raster Carbon Rheostat company and the W. R. Garton company, Chicago, appeared in the persons of W. R. Garton and H. E. Lee. Mr. Garton and Mr. Lee have recently formed the W. R. Garton company, and a few months ago Mr. Garton assumed the position of consulting engineer for the Raster Carbon Rheostat company, and in this capacity he represented the Raster company and explained the merits of the Raster Carbon rheostat. This device is a decided novelty, in that it is claimed for it that it is the only successful carbon rheostat, and that whether the resistance be hot or cold, it remains constant. Those interested in the carbons of the Raster company will do well to send for the company's new circular, which explains in detail the merits of this interesting device.

Vice-president and General Manager Robert F. Carr and C. M. Eddy, in the absence of President Edgar, kept the Dearborn Drug and Chemical Works of Chicago most prominently to the front. It had been hoped that Mr. Edgar would return from his trip in time to take advantage of the visit of the National convention but the Northwestern convention as well, but he was unable to make it. But Messrs. Carr and Eddy told the story of the company's many virtues. As it is now pretty generally known, through the company's extensive advertising, the Dearborn company is handling the problem of boiler cleansing in a most thorough and scientific manner. It is apparently a case of making the punishment fit the crime and the medicine fit the sickness. In a word, the Dearborn Drug and Chemical Works prescribes a compound to suit and cure every case of boiler disease.

The Columbia Incandescent Lamp company of St. Louis was represented at the convention by Garrison, Chicago Manager George P. Rex and Guy V. Williams. The company made no exhibit. Mr. Garrison was unable to reach Chicago until Wednesday morning, and, owing to his father's sudden illness, was unable to remain to attend the regular western gathering at Duluth. Messrs. Rex and Williams were appointed to carry out this portion of the programme. Since Mr. Rhotehamel's sudden death Mr. Garrison has taken up the reins of office and with work, but he has well withstood the strain. In fact he has carried the entire load and responsibility of the business, and it may be said to his great credit that not only has the company prospered, but it has done business under the management than at any previous like period. Mr. Garrison is now one of the convention "regulars," and it was a matter of great regret that he could not continue on to Duluth.

The Westinghouse Electric and Manufacturing company, with headquarters at 104 and 106 Auditorium, was ably represented by F. H. Taylor, general sales manager; Arthur Warren and A. S. Morris of Pittsburg, and by Maurice Coster, Chicago sales manager; Henry Troy, W. A. Stagg, C. W. Regester and T. J. McGill of Chicago. The company's headquarters were tastefully decorated in the national and Cuban colors. It also exhibited a few well-selected pictures, showing details of its various manufactures and views of the shops. All the above-mentioned gentlemen are well known to the electrical trade, and on account of their popularity the Westinghouse quarters were thronged with guests, which greatly facilitated the arrangements which had been made for their comfort. A neat effect was exhibited in the form of a shield with the company's motto. The name Westinghouse is a guarantee," a remark thereon, which is true of its hospitality as well as its high-grade apparatus.

The Wagner Electric Manufacturing company of St. Louis was represented in the convention by the following-named gentlemen: Mr. E. H. Abadie, manager; Messrs. S. E. Hibbard, Swenson and S. Pillsbury of the engineering staff, and Mr. W. A. Layman, assistant manager. Their suite of rooms at the Auditorium was attractively arranged, with quite a display of designs of their latest apparatus in switchboards, transformers, motors, etc. The new actual apparatus shown was a model set of indicating switchboard instruments of the illuminated dial "dead-beat" type. The reception hours were between conventional hours for business, and all were royally entertained. The company distributed as a souvenir of the convention a unique button, the central feature of which was the Wagner company's transformer enfolded in the American and Cuban flags. A significant motto, "In test we trust," was also conspicuous. Mr. H. A. Wagner came as the official representative of the Missouri Edison Electric company, and was also a representative of the Wagner company.

The Sprague Electric company was strongly represented by Vice-president and General Manager Edward H. Johnson, General Agent Charles A. Benton and Western Agent E. B. Kuttle. Through the courtesy of President Carter of the Alley "L" an invitation was extended to members of the convention to make a trip over the line in a new and special train equipped with the Sprague multiple-unit system. This occurred on Tuesday night, and remarkable time was made, the train stopping at all stations. The Sprague Electric company, as now well known, is making an aggressive campaign, with the idea of increasing its already very large western business. As is also well known, Mr. Kittle has recently taken charge as western manager, and he is doing excellent work. He secured the choicest place in the Auditorium as a stand for the inspection of the new Lundell "hot and cold wave" fan. This specialty is one that will be shortly described in detail by the company. This new Lundell fan delivers a hot and cold wave, as desired. In fact, it is something of an electrical curiosity, and will prove of decided interest to every supply house, as through its use one can secure a current of hot or cold air, as desired, by the simple movement of a switch.

The clubroom No. 4 of the Auditorium Hotel, was beautifully decorated with the stars and stripes. This was the temporary home of the Western Electric company during the session of the National Electric Light association, and the members and guests found a ready welcome awaiting their visits to this cosy retreat. The company made no attempt at an exhibit, but the Western Electric fan motors distributed around the room made the temperature agreeable, and Sunbeam incandescent lamps and Midget arc lamps made the room brilliant. Literature describing the various makes of dynamos, electric-light switchboards, arc lamps, fan motors, etc., was freely distributed. Placed around the hotel in advantageous positions, the Western Electric fan motors kept the guests of the rotunda comfortable and proclaimed Cuba Libre. One of the graceful acts thoroughly appreciated by those attending the meetings was the furnishing of a large number of Japanese fans by this same company. The gentlemen representing the company and in attendance at the headquarters were General Manager C. D. Crandall, Col. George L. Beetle and Messrs. A. L. Tucker, John Ebert, F. W. Goldschmidt, C. D. Wilkinson, Julian Jackson, M. Hollister, L. K. Comstock and Thomas G. Grier. The factory of the Western Electric was thrown open to the visitors, and a number availed themselves of the opportunity of making a tour of inspection.

The General Electric company was represented at the convention by the general selling staff of its Chicago office and several representatives from the other sales offices. It made no exhibit, but parties of delegates were made up for the purpose of visiting the different great shops of the company equipped with the latest types of General Electric apparatus. By the kindness of President Insull of the Chicago Edison company and Mr. W. E. Baker of the Metropolitan West Side Elevated Railroad company the stations of both companies were thrown open to these parties. Mr. Insull's sub-station system attracted much attention. A large delegation also accepted Mr. B. E. Sunny's invitation to visit the large storehouse and repair shops where the General Electric company has established in Chicago for the purpose of facilitating its relations with the customers in the great territory covered by the Chicago office. The General Electric company made its headquarters at the Auditorium Hotel in room 140, which was tastefully decorated with palms and ferns. A supply of illustrated literature was also provided for those interested. The interests of the company were looked after by the following named gentlemen: Chicago office, B. E. Sunny, F. N. Boyer, Theo. P. Bailey, J. Scribner, W. S. Arnold, W. J. Ferris, G. J. Cadwell, J. W. Buell, J. W. Johnson, E. C. Moe, E. Turner, A. J. Gifford, G. H. Atkin, H. T. Windsor, S. F. Gibble, W. H. Colman, J. J. O'Brien; Minneapolis office, P. A. Chsdell; St. Louis office, George D. Rosenthal; Detroit office, J. H. Livsey; Cincinnati office, W. F. Hays, W. J. Hanley; Philadelphia office, D. Prentiss; Boston office, F. M. Kimball; Syracuse office, H. H. Crowell; Schenectady works, W. S. Andrews, Lynn works, J. Dalzell; Harrison works, A. D. Page

The Attendance.

Owing to the number of visitors who did not register, the exact number of members and visitors at the convention will never be known, but probably about 400. A group picture of a small portion of the number of gentlemen in attendance, taken on the grand staircase of the Auditorium Hotel, is given on pages 340 and 341. The following list contains many names not on the secretary's book, but it is still incomplete.

Abadie, E. H., Wagner Electric Manufacturing company ..... St. Louis.
Abbott, John Jay, Chicago Edison company ..... Chicago.
Abbott, E. C., Chicago Edison company ..... Chicago.
Adams, Henry C., Jr., Phillips Insulated Wire company ..... Pawtucket, R. I.
Allen, R. D., Siemens & Halske Electric company ..... Chicago.
Anderson, H. S., United Electric Light company ..... Springfield, Mass.
Andres, J. Frank, Belleville Gas Light and Power company ..... Belleville, Ill.
Andrews, W. S., General Electric company ..... Schenectady, N. Y.
Anthony, W. M., Chicago Edison company ..... Chicago.
Appleton, A., Electric Storage Battery company ..... Philadelphia.
Armstrong, G. ..... Chicago.
Armstrong, F. E., Camden Lighting and Heating company ..... Camden, N. J.
Armstrong, F. C., Dick, Kerr & Co. ..... London, England.
Arnold, W. L., Siemens & Halske Electric company ..... Chicago.
Atkin, G. H., General Electric company ..... Chicago.
Atkinson, H. M., Georgia Electric Light company ..... Atlanta.
Atkinson, J. M., J. M. Atkinson & Co. ..... Chicago.
Austin, M. L., Safety Insulated Wire and Cable company ..... Chicago.
Ayer, James E., American Electric Heating company ..... Boston.

Babbitt, H. D., Chicago Edison company.......Chicago.
Badger, F. H., Jr., Montmorency Electric Power company.......Quebec, Canada.
Badt, F. B., Meysenburg & Badt.......Chicago.
Baird, M. E., Eddy Electric Manufacturing company.......Windsor, Conn.
Baker, C. O., Anchor Electric company.......Chicago.
Baker, C. O., Jr., Baker & Co.......New York.
Barker, F. E., Massachusetts Gas and Electric Light Commission.......Boston
Barr, Edward L., W. R. Brixey.......Chicago.
Barron, A. M., Home Electric Light and Power company.......Elkhart, Ind.
Bean, W. Worth, Jr., St. Joseph and Benton Harbor Electric Railway and Light company.......St. Joseph, Mich.
Beetle, George L., Western Electric company..Chicago.
Bement, A., Bement & Co.......Chicago.
Benton, C. A., Sprague Electric company....New York.
Billings, Miss H.......New York.
Blum, A. J., American Carbon company....Fremont, O.
Boettcher, C., Imperial Electric Light company.......St. Louis.
Booker, S. G., Phœnix Carbon Manufacturing company.......St. Louis.
Bowen, G. S.......Elgin, Ill.
Boyer, F. N., General Electric company.......Chicago.
Bradley, J. M., Birmingham Consolidated Electric company.......Birmingham, Ala.
Brinckman, E. S., Imperial Electric Light company.......St. Louis.
Brooke, W. M., Electric Appliance company.......New Orleans, La.
Brooks, F. A., Charleston T.-H. Electric company.......Charleston.
Brooks, H. H., American Circular Loom company.......Boston.
Brooks, J. W., Brooks-Follis Electrical corporation.......San Francisco.
Brown, C. E., Central Electric company.......Chicago.
Buckley, W. J.......Chicago.
Burleigh, J. J., and wife, Atlantic Electric Light and Power company.......Camden, N. J.
Burns, P. C., American Electric Telephone company.......Chicago.
Burton, C. G., Central Electric company......Chicago.
Butler, W. W. S., Milton Electric Light and Power company.......Milton, Pa.

Candee, Willard L., Okonite company.......New York.
Carlton, W. G., Chicago Edison company.....Chicago.
Carnes, S. T., Memphis Light and Power company.......Memphis, Tenn.
Carr, R. F., Dearborn Drug and Chemical Works.Chicago.
Cate, George W., Edison Illuminating company.......Detroit, Mich.
Channon, H. O.......Quincy, Ill.
Cheney, H., Chicago Edison company.......Chicago.
Child, John.......Chicago.
Childs, Charles T., American Electrician....New York.
Church, J. V. S., Electrical World.......Chicago.
Church, W. L.......Milwaukee.
Clark, E. W.......Evanston, Ill.
Clark, Frank H., Electric Storage Battery company.......Chicago
Clisdell, Percy A., General Electric company.......Minneapolis, Minn.
Coggshall, H. F., Fitchburg Gas and Electric Light company.......Fitchburg, Mass.
Coleman, Charles E., Eugene Munsell & Co....Chicago.
Collins, L. W., Leecol Storage Battery company.Chicago.
Collins, W. F., Western Electrician.......Chicago.
Comstock, C. G., Smith-Hill Elevator company.......Quincy, Ill.
Comstock, L. K., Western Electric company....Chicago.
Condit, Sears B., L. A. Chase & Co.......Boston.
Connor, J. F.......Chicago.
Conover, George W.......Chicago.
Cooke, J. H., Buckeye Electric company.......Chicago.
Cooper, Thomas, Pekin Electric Light and Power company.......Pekin, Ill.
Copeland, F. A., Edison Light and Power company.......La Crosse, Wis.
Coster, Maurice, Westinghouse Electric and Manufacturing company.......Chicago.
Crandall, C. D., Western Electric company....Chicago.
Cravath, J. R.......Chicago.
Crawford, Ronald, Stamford Gas and Electric company.......Stamford, Conn.
Creden, T. H., Chicago Edison company.......Chicago.
Crider, J. S., Washington Carbon company.......Pittsburg, Pa.
Crossman, T. E., official stenographer......New York.
Crouse, J. B., Crouse-Tremaine Carbon company.......Fostoria, O.
Crowell, H. H., General Electric company.......Syracuse, N. Y.
Culver, J. H., Culver Electric company....Decatur, Ill.
Cummings, James F., Armorite Interior Conduit company.......Pittsburg, Pa.
Cunningham, J. W., Capital Electric Light, Motor and Gas company.......Boise, Idaho.
Cushing, L. K., Illinois Electric company......Chicago.
Cutler, Harry H., Cutler-Hammer Manufacturing company.......Chicago.
Cutter, George.......Chicago.
facturing company.......Pittsburg, Pa
Cutter, Henry B., and wife, Cutter Electrical and Manufacturing company.......Philadelphia.

Daggett, R. B., Electric Storage Battery company.......Chicago.
Dale, John H., Dale company.......New York.
Daniels, A. L., the H. B. Camp company.North East, Pa.
Davis, Ernest H., Lycoming Electric company.......Williamsport, Pa.
De Camp, A. J., Brush Electric Light company.......Philadelphia.
Dee, A. V.......Philadelphia.
Dee, James R., Peninsula Electric Light and Power company.......Houghton, Mich.
De Land, Fred, Electrical Engineering.......Chicago
Dibble, S. F., General Electric company.......Chicago.
Dickey, Edmund, American Carbon company.......Noblesville, Ind.
Doan, J. P., Jacksonville Gas Light and Coke company.......Jacksonville, Ill.
Doherty, H. L., Madison Gas and Electric company.......Madison, Wis.
Donohoe, F. E., American Electrical Works...Chicago.
Dow, Alex, Mutual Electric Light company.......Detroit, Mich.
Downes, L. W., D. & W. Fuse company.......Providence, R. I.
Downs, B. B., Electric Appliance company.Minneapolis.
Drake, C. F., Fort Scott Electric Light and Power company.......Fort Scott, Kan.
Dull, P.......Milledgeville, Ill.
Dysterud, E., Electric Light company...Monterey, Mex

Ebert, J. W., Western Electric company.......Chicago.
Eddy, Charles M., Dearborn Drug and Chemical Works.......Chicago.
Edgar, H. T., Jandus Electric company.......Boston.
Einstein, A. C.......St. Louis.
Ely, J. H., Georgia Electric Light company.Atlanta, Ga.
Engel, W. T., Charlotte Electric company.......Charlotte, N. C.

Fakes, J. G.......Oklahoma City, O. T.
Ferguson, Louis A., Chicago Edison company.Chicago.
Ferguson, James, Municipal Electric Light company.......Brooklyn, N. Y.
Ferris, Thomas, General Electric company.......Milwaukee, Wis.
Ferris, W. J., General Electric company.......Chicago.
Field, C. J., Port Jervis Electric Railway and Light company.......New York.
Field, A. W., Columbus Edison Electric company.......Columbus, O.
Finney, W. E., Chicago Edison company.......Chicago.
Floy, Henry, Westinghouse Electric and Manufacturing company.......Minneapolis, Minn.
Forbrich, C. W., Western Electrician.......Chicago.
Foster, George B., Walker company.......Chicago.
Francis, Robert W., Chicago Edison company..Chicago.
Frank, Jacob, Cosmopolitan Electric company..Chicago.
Frank, S. S., Western Electric company.......Chicago
Fraser, R. H., Des Moines Edison Light company.......Des Moines, Ia.
Frith, Harry J., Watseka Electric Light company.......Watseka, Ill.
Fujioka, I., Japan Electric Light association.......Tokyo, Japan.

Gage, Channing T., Washburn & Moen Manufacturing company.......St. Paul, Minn.
Gardner, J. W., Stirling company.......Chicago.
Garrison, A. C., Columbia Incandescent Lamp company.......St. Louis.
Garton, W. R.......Chicago.
Gates, J. Holt, Walker company.......Chicago.
Gilbert, L. H., Jonesville Electric Light and Power company.......Jonesville, Mich.
Gilchrist, J. F., Chicago Edison company......Chicago.
Gille, H. J., Edison Electric Light and Power company.......St. Paul, Minn.
Gillmer, Elmer W. Warren Electric and Specialty company.......Warren, O.
Goehst, J. H., Chicago Edison company.......Chicago.
Goldborough, W. E., professor in Purdue University.......Lafayette, Ind.
Goldschmidt, E. W., Western Electric company.Chicago.
Goodhue, Wells.......Chicago.
Gordon, Thomas S.......Chicago.
Greenwood, C. H., Edison Light and Power company.......La Crosse, Wis.
Gregory, Charles E.......Chicago.
Gregory, John M., City electric light...Bellefontaine, O.
Grier, Edward R., Bryant Electric company...Chicago.
Grier, Thomas G., Western Electric company..Chicago.

Habirshaw, Dr. William, India Rubber and Gutta Percha Insulation company.......New York.
Hagar, Edward M., Southwark Foundry and Machine company.......Chicago.
Hammond, Edgar H., American Electrical Works.......Chicago.
Hanley, W. J., General Electric company..Cincinnati, O.
Hapeman, Douglas, Thomas Electric Light and Power company.......Ottawa, Ill.
Harding, C. Knox.......Chicago.
Harrington, Walter E., and wife, Camden and Suburban Railway company.......Camden, N. J.
Harris, B. F., Jr., Urbana and Champaign Railway, Gas and Electric company.......Champaign, Ill.
Hart, F. D., Jr., Pineville Electric Light company.......Pineville, Ky.
Harter, Gus.......Chicago.
Hayes, Scott.......Cleveland, O.
Hays, W. P., General Electric company..Cincinnati, O.
Healy, Frank E., Illinois Electric company....Chicago.
Hine, William S., Stanley Electric Manufacturing company.......Chicago.
Hirota, Seuchi, Takata & Co.......Tokyo, Japan.
Hixson, H. R., Simplex Electrical company....Chicago.
Holcomb, Eugene, Holcomb & Green Electric company.......Springfield, Ill.
Hold, W. F., Chicago General Fixture company.Chicago.
Holl, Thomas, Smith-Hill Elevator company..Quincy, Ill.
Hollister, J. M., Western Electric company....Chicago.
Holmes, Charles, Chicago Edison company......Chicago.
Hood, William.......Chicago.
Hornsby, H. H., Electrical Exchange.......Chicago.
Hubbard, W. M., Bradford Belting company.......Cincinnati, O.
Hubley, G. Wilbur, Louisville Electric Light company.......Louisville, Ky.
Hughes, W. D., Central Manufacturing company.......Chattanooga, Tenn.
Hull, J. W., Cabinet Manufacturing company.......Steubenville, O.
Humphrey, H. H., Bryan & Humphrey.......St. Louis.
Hunt, Charles B., London Electric company.......London, Ont.
Huntley, C. R., Buffalo General Electric company.......Buffalo.
Hurd, G. A., Crane company.......Chicago.
Hutchins, A. W., D. & W. Fuse company.......Providence, R. I.

Insull, Martin J., C. & C. Electric company....Chicago.
Insull, Samuel, Chicago Edison company.......Chicago.

Jackson, George T., National Conduit and Cable company.......New York.
Jackson, D. C., professor in the University of Wisconsin.......Madison, Wis.
Jampolis, Henry, Chicago Edison company.....Chicago.
Jenney, Charles D., Jenney Electric Manufacturing company.......Indianapolis.
Jennings, John J., Wilkinsburg Electric company.......Wilkinsburg, Pa.
Johannsson, J. E., Wagner Electric Manufacturing company.......St. Louis.
Johns, S. C. D., and wife, Cleveland Electric Illuminating company.......Cleveland, O.
Johnson, Edward H., Sprague Electric company.......New York.
Johnson, J. W., General Electric company....Chicago.
Jones, George H., Chicago Edison company....Chicago.

Kammeyer, C. E., Electrical Review.......Chicago.
Keck, T. P., Brush Electric Light company.......Savannah, Ga.
Kelsch, R. S., Lachine Rapids Hydraulic and Land company.......Montreal, Canada.
Kelly, W. E., Western Electrician.......Chicago.
Keith, Carl, Illinois Electric company.......Chicago.
Kimball, Frederick M., General Electric company.Boston.
Kimbrough, Hal. C., Muncie Electric Light company.......Muncie, Ill.
Kingan, W. F., Edison Sault Electric company.......Sault Ste. Marie, Mich.
Kitt, M. B., Sprague Electric company.......Chicago.
Kittle, E. B., Sprague Electric company.......Chicago.
Knox, G. W., Chicago City Railway company..Chicago.
Knox, J. M., Central Electric company.......Chicago.
Kohler, G. A. Edward, Kohler Bros.......Chicago.
Korst, P. H., Badger Electric company....Racine, Wis.
Kreidler, W. A., Western Electrician.......Chicago.

Lane, T. S., Electrical Exchange.......Chicago.
Lang, A. E., Toledo Consolidated Electric company.......Toledo, O.
Layman, W. A., Wagner Electric Manufacturing company.......St. Louis.
Leslie, E. A., Manhattan Electric Light company.......New York.
Leibrock, C. L., Chicago Edison company.....Chicago.
Lewis, Theodore Graham, Chicago Edison company.......Chicago.
Livsey, J. H., General Electric company..Detroit, Mich.
Lloyd, Herbert, Electric Storage Battery company.......Philadelphia.
Lockwood, Joseph D., Michigan Electric company.......Detroit, Mich.
Long, George.......Chicago, Ill.
Low, W. W., Electric Appliance company......Chicago.
Lowell, James G., Bay County Electric company.......Bay City, Mich
Lucas, R. E., Indiana Rubber and Insulated Wire company.......Marion, Ind.
Lukes, J. B., United States Electric Lighting company.......Washington, D. C.
Luthy, G. G., Royal Electric company......Peoria, Ill.

MacConnell, W. J., Electrical Engineer.......Chicago.
Mahony, Gerald, Lakon company.......Elkhart, Ind.
Manson, George T., Okonite company.......New York.
Marsh, Converse D., Bryan-Marsh company..New York.
Marshall, Norman, Anchor Electric company.....Boston.
Matlock, E. V., Laclede Power company.....St. Louis.
Matthews, W. N., St. Louis Electrical Supply company.......St. Louis.
McDonald, W. B., Commonwealth Electric company.......Chicago.
McGhie, J., General Electric company......New York.
McGill, T. Julian, Westinghouse Electric and Manufacturing company.......Chicago.
McGraw, J. H., American Electrician.......New York.
McKinlock, George A., Central Electric company.Chicago.
McKinlock, W. H.......Chicago.
McQuaide, James P., National Conduit and Cable company.......New York.
Mercein, Thomas R., secretary Northwestern Electrical association.......Milwaukee, Wis.
Merrill, F. L.......Chicago.
Messer, Charles, Dearborn Electric company...Chicago.
Miller, J. H., Springfield Electric Light and Power company.......Springfield, O.
Miller, A. M., Red Oak Electric company..Red Oak, Ia.
Mitchell, O.......Muncie, Ind.
Mold, William S., Star Electric company....Dubuque, Ia
Morgan, H. B., Jewell Belting company.......Chicago.
Morrell, A. W., Miller-Knoblock company.......South Bend, Ind.
Morrill, J. B., Evanston Electric Illuminating company.......Evanston, Ill.
Morgan, Miss Carrie W.......Camden, N. J.
Morse, S. F. B.......Chicago.
Morse, A. M., Atlas-Corliss company.......Chicago.
Mustard, John, Wagner Electric Manufacturing company.......Philadelphia.

Neal, George B., Charlestown Gas and Electric company.......Boston.
Neiler, S. D., Pierce & Richardson.......Chicago.
Nelson, Frederick, Westinghouse Electric and Manufacturing company.......Chicago.
Noe, E. C., General Electric company.......Chicago.
Norcross, E. P.......Janesville, Wis.

O'Connor, Richard, National Carbon company.Cleveland.
O'Hara, J. B., Western Electrician.......Chicago.
Obermeyer, Charles B., Electric Appliance company.......Chicago.
Overbagh, F., Chicago General Fixture company.Chicago.

Packard, W. D., New York and Ohio company.......Warren, O.
Page, A. D., General Electric company..Newark, N. J.
Paige, C. C., Electric Light and Power company.......Oshkosh, Wis.
Patterson, George W.......Chicago.
Patterson, M. E.......Chicago.
Perkins, C. G., Perkins Switch Manufacturing company.......Hartford, Conn.
Perry, F. L., Western Electrician.......Chicago.
Perry, C. C., Indianapolis Light and Power company.......Indianapolis, Ind.
Philbrook, C. H., Walker company.......Chicago.
Phillips, Frank N., American Electrical Works.......Providence.
Pierce, R. H., Pierce & Richardson.......Chicago.
Pillsbury, Edwin S., Wagner Electric Manufacturing company.......St. Louis.
Pimlott, W. E., Sargent & Lundy.......Chicago.
Porter, George F., Kerite wires and cables..New York.
Pratt, Charles A.......Chicago.
Pratt, Frederick S., Cumberland Electric Light and Power company.......Nashville, Tenn.
Prentiss, I. R., General Electric company..Philadelphia.
Price, Charles R., New Bedford Gas and Edison Light company.......New Bedford, Mass.
Price, Charles W., Electrical Review.......New York.
Pritchard, W. R., Westinghouse company......Chicago.
Pumpelly, J. K.......Chicago.
Pyle, James E., Edison Electric Illuminating company.......West Chester, Pa.

Rae, F. B.......Chicago.
Randolph, R. J., Sterling Arc Lamp company.New York.
Ray, William D., Johnson company.......Chicago.
Reber, James C., Dayton Electric Light company.......Dayton, O.
Redman, George A., and wife, Brush Electric Light company.......Rochester, N. Y.
Reeves, J. W., Johnstown Electric Light company.......Johnstown, Pa.
Regester, C. W., Westinghouse Electric and Manufacturing company.......Chicago.
Rex, George P., Columbia Incandescent Lamp company.......Chicago.
Rice, C. W., Kings County Electric Light and Power company.......Brooklyn, N. Y.
Richardson, R. E., Pierce & Richardson.......Chicago.
Richmond, F. S.......Chicago.
Robertson, A. M., Minneapolis General Electric company.......Minneapolis, Minn.
Robinson, D. P., Edison Electric Illuminating company.......Baltimore, Md.
Rockwood, G. O., Rockwood Manufacturing company.......Indianapolis, Ind.
Roehl, Charles E., St. Joseph Railway, Light, Heat and Power company.......St. Joseph, Mo.
Rogers, L. H., Fort Wayne Lamp company.......Cleveland, O
Rose, E. M., Farmington Electric Light company.......Farmington, Ill.
Rosenthal, George D., General Electric company.......St. Louis.
Ross, C. A., Sawyer-Man Electric company......Chicago.

Schayer, John J., Commonwealth Electric company.......Chicago.
Scheeffer, G. A., Diamond Electric company..Peoria, Ill.
Schott, W. H., Commonwealth Electric company.Chicago.
Schuchardt, R. F., Meysenburg & Badt.......Chicago.
Scribner, J., General Electric company.......Chicago.
Searing, George S., Hart & Hegeman company.Chicago
Searles, A. M., Diamond Electric company......Chicago.
Shain, Charles D., Weston Electrical Instrument company.......New York.
Shainwald, J. C., Standard Paint company....Chicago.
Shaw, A. C., Electrical Engineer.......New York.
Shay, J. H., Charles Munson Belting company..Chicago.
Smith, C. R., Manhattan Light, Heat and Power company.......St. Paul, Minn.
Smith, F. E., Lynn and Boston Street Railroad company.......Boston.
Smith, H. S., Sawyer-Man Electric company..Pittsburg.
Smith, T. Ellwood, Somerville Electric Light company.......Boston.
Smith, William M., Chicago Insulated Wire company.......Chicago.
Smith, W. S., Toledo Consolidated Electric company.......Toledo, O.
Stacey, Thomas I., Electric Appliance company.Chicago.

Stearnes, R. S., Fort Wayne Electric corporation ..... New Orleans, La.
Stern, M. L., city electrician ..... Denver, Colo.
Stetson, George R., New Bedford Gas and Edison Light company ..... New Bedford, Mass.
Stieringer, Luther ..... New York.
Sullivan, W. P. ..... Chicago.
Sunny, B. E., General Electric company ..... Chicago.
Syvanus, John, Bullock Manufacturing company ..... Chicago.
Swetland, H. M., Power Publishing company ..... New York.

Tailleur, George, Chicago Edison company ..... Chicago.
Taylor, Frank H., Westinghouse Electric and Manufacturing company ..... Pittsburg, Pa.
Thayer, George L., Belle Plaine Electric Light company ..... Belle Plaine, Ia.
Thorne, J. J., Electric Engineering company ..... Hay City, Mich.
Tompkins, W. H., city electric lighting plant ..... Niles, Mich.
Torbert, H. G., Dubuque Light and Traction company ..... Dubuque, Ia.
Towner, H. L. J., Electric Appliance company ..... Chicago.
Trafman, E. E. R., Engineering News ..... Chicago.
Trego, Charles H., Hoopeston Electric company ..... Hoopeston, Ill.
Trump, Samuel N., Wilmington City Electric company ..... Wilmington, Del.
Tucker, A. L., Western Electric company ..... Chicago.

Upham, W. P., Central Electric company ..... Chicago.
Uptegraff, J. W., Sewickley Electric company ..... Sewickley, Pa.
Urquhart, D. F. ..... T.-H. Carbon company ..... Boston.

Van Trump, C. R., Wilmington City Electric company ..... Wilmington, Del.
Varney, G. E., Varney & McOuat ..... Indianapolis.

Wade, E. E., El Paso Electric company ..... Colorado Springs, Colo.
Wagner, Herbert A., Missouri-Edison Electric company ..... St. Louis.
Walbank, W. McLea, Lachine Rapids Hydraulic and Land company ..... Montreal, Canada.
Warren, Arthur, Westinghouse Electric and Manufacturing company ..... Pittsburg, Pa.
Watriss, A. W., Charles A. Schieren & Co. ..... Chicago.
Webb, A. F., American Carbon company ..... Noblesville, Ind.
Weib, H. E., Solar Carbon and Manufacturing company ..... Pittsburg, Pa.
Weeks, Edwin R., Kansas City Electric Light company ..... Kansas City, Mo.

SEYMOUR SWARTS.

Wells, H. S., Smith-Hill Elevator company ..... St. Louis.
Wells, R. S., Shelbyville Water and Light company ..... Shelbyville, Ill.
Wells, Edward F., Shelbyville Water and Light company ..... Shelbyville, Ill.
Wells, C. J., Electric Appliance company ..... Chicago.
Wendle, G. E., Lycoming Electric company ..... Williamsport, Pa.
Wetzler, Jefferson, Electrical Engineer ..... New York.
Wetzler, Joseph, and wife, Electrical Engineer ..... New York.
Whyte, George S., Leschen-Macomber-Whyte company ..... Chicago.
Wiley, J. R., Standard Underground Cable company ..... Chicago.
Wilkins, E. Ward, Partrick, Carter & Wilkins ..... Philadelphia.
Wilkinson, C. D., Western Electric company ..... Chicago.
Williams, Guy V., Columbia Incandescent Lamp company ..... St. Louis.
Williams, John R., Electric Storage Battery company ..... Philadelphia.
Wilmerding, C. H., Chicago Sectional Underground Electric company ..... Chicago.
Wilson, Charles E., Fort Wayne Electric corporation ..... Philadelphia.
Windsor, H. H., Street Railway Review ..... Chicago.
Wolff, James, New York Insulated Wire company ..... Chicago.
Wood, Elmer E., American Electrician ..... New York.
Woodbridge, J. E., Electrical World ..... New York.
Woolling, Elmer ..... Logansport, Ind.
Woodrow, C. E. ..... Stony City, Ia.
Wormley, J. C. ..... Chicago.
Wright, Porter, Virginia Electric company ..... Norfolk, Va.
Wunder, F. A., Fort Wayne Electric corporation ..... New York.
Warts, Alexander J., Westinghouse Electric and Manufacturing company ..... Pittsburg, Pa.
Wyant, Robert E., Derby Gas company ..... Derby, Conn.

Yates, A. G. ..... Newton, Ia.
Young, E. P. ..... Sewickley, Pa.
Young, John, Western Electric company ..... Chicago.
Young, S. Marsh, Manhattan General Construction company ..... New York.

Zamel, A. G., Zamel Arc Light Meter company ..... Chicago.

The Snoqualmie Power company is experiencing difficulty in securing a franchise to distribute electric power in Tacoma.

Seymour Swarts.

In the accompanying portrait is shown a very good likeness of Seymour Swarts, president of the Swarts Metal Refining company of Chicago. Although comparatively a young man, Mr. Swarts has met with flattering success in the metal-refining business. The company was established in 1885 by the senior Mr. Swarts, and the subject of this sketch took active charge in 1895. Mr. Swarts was born in Chicago in 1868, and has had 17 years' experience in the metal business. His wide acquaintance and close attention to business have enabled him to build up a large trade until, at the present time, the Swarts Metal Refining company is perhaps better known than any concern engaged in a similar business throughout the United States. The principal business of the Swarts company in connection

IMPERIAL OVERLOAD MOTOR STARTER.

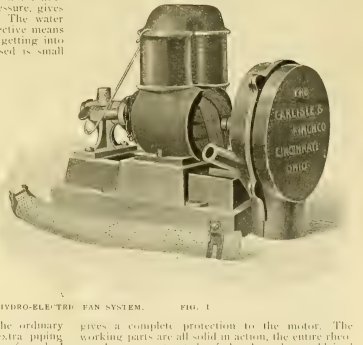
with electric-light and electric-railway plants is the buying and selling of bare copper trolley wire, insulated copper wire, brass and aluminum. Through the energy of Mr. Swarts this business has been built up to such an extent that the company is now doing business with two-thirds of the electric-lighting plants and three-fourths of the electric street railways throughout the country. Mr. Swarts is personally acquainted with most of his customers, and it is safe to say that it would be hard to find a more genial man to do business with. The company bears an enviable reputation, and its dealings with its customers have always given the best of satisfaction. The company started with one small solder kettle and one testing furnace. At the present time it is operating six large kettles and nine furnaces with a capacity of 30,000 pounds of metal per day. This is certainly a good showing and an example of Chicago enterprise.

Hydro-electric Fan System.

The Carlisle & Finch company of 828-830 West Sixth street, Cincinnati, announces a water-driven electric ventilating system, consisting of a water motor designed to be attached to an ordinary bousehold faucet, a small dynamo driven by the water motor and an electric fan motor supplied with current from the dynamo and placed wherever desired. Turning on the water sets the fan in motion and produces a powerful breeze. By this system it is possible to enjoy the delights of the electric fan in apartment buildings or other structures not wired for electric current. The current is of but 20 volts potential and is harmless.

The dynamo end of the combination is shown in Fig. 1. The generator is of the simple horseshoe-frame type, and, at 50 pounds water pressure, gives a current of one ampere at 20 volts. The water motor is of brass, and it is said that effective means are adopted to prevent the water from getting into the dynamo. The quantity of water used is small

FIG. 2.



HYDRO-ELECTRIC FAN SYSTEM. FIG. 1

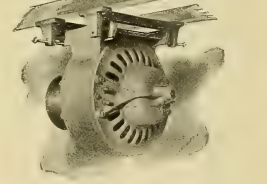
and can be readily carried away by the ordinary waste pipe of sink or bathtub. No extra piping is required, and hose connections are furnished with each dynamo. The weight of dynamo and water motor is 28 pounds. The dynamo may furnish current for experimental purposes, and can be had without the fan.

Fig. 2 shows the electric fan motor driven from the dynamo. The fan can be placed in any part of the house. The wires are light and small and are not unsightly. They may be strung across the floor, back of chairs, over gas jets, etc., being loosely coiled up when not in use. The fan is four bladed and nine inches in diameter. It weighs 10 pounds, and gives a complete protection to the motor. The working parts are all solid in action, the entire rheostat being constructed of handsomely marbleized slate (in all exposed parts) and iron, rendering it fireproof. The resistance is in the form of coils. The smaller sizes of wire are wound on asbestos, and the standard sizes are made to stand the current for 30 seconds under full load. The Imperial motor starter is guaranteed by the company to be the equal of any motor starter on the market.

An electric railway is projected from Clear Lake, Ia., to Klemme, thence to West Lake and Clarion.

Commercial Ironclad Motor.

The accompanying cut shows the new Commercial ironclad motor, which has just been placed on the market by the Commercial Electric company, Indianapolis, Ind. As will be seen from the illustration, it is very compact and attractive in appearance, as well as thoroughly protected from mechanical injury, dirt and dust, while the large lids which are placed on the casing above and below the commutator allow of easy access to the brushes when desired. The method of mounting is admirably adapted for ceiling suspension, as well as for installation directly on the floor or foundations, and when suspended as shown in the cut the operation of the belt-tightening



COMMERCIAL IRONCLAD MOTOR.

device is in no way intertered with. Since there are no bolts to be loosened, the machine can be mounted on its support, as with other ceiling machines. It is extremely convenient for direct belting to elevator machines when used in this way, and the company makes a special reversible motor and controller for this purpose. The magnet frame is of steel, with circular cores and pole-shoes of the same material, thus affording a low-resistance air-gap and greatest possible efficiency of the magnetic circuit, while the end casings which carry the bearings are of cast-iron and are provided with ample ventilating holes. The workmanship and material throughout are of the highest class. The shafts are of steel, with self-oiling bearings.

Carbon brush holders of simple construction and large capacity are used, and, owing to the strong magnetic field, sparking and change of lead are avoided, so that the machines may run for a long time and require little attention. The motors are built in two standard speeds, so that they are adapted to a large variety of uses.

Imperial Overload Motor Starter.

The accompanying cut represents one form of motor starter, having magnetic release and overload attachment, manufactured by the Ohio Electric Specialty Manufacturing company of Troy, O. This starting-box has all the advantages of the regular motor starter, besides protecting the motor from overload due to sudden rush of current, caused by short-circuit or other causes. The overload device is placed in the main armature circuit, and, acting in conjunction with the magnetic release,

New Peru Porcelain Specialties.

The accompanying cut illustrates a few of the new porcelain specialties that have recently been presented to the trade through the new catalogue of the Peru Electric Manufacturing company of Peru, Ind.

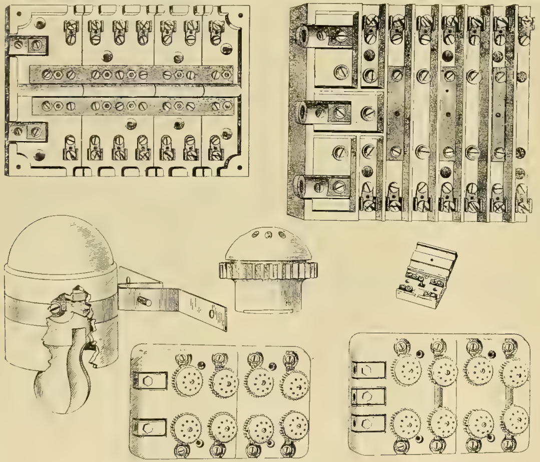
The two-wire multiple-circuit block and the three-wire circuit block, shown in the group, may be extended for any number of circuits desired. The company claims, too, that all multiple blocks built in sections are infringements upon its patents.

The "new Peru plug" will also be readily distinguished in the group. This plug has a capacity of 25 amperes; is arranged to carry a long fuse and has a ventilated cap. This device is all porcelain.

The two and three-wire multiple-circuit tablet boards are also shown. The two-wire tablet board can be built in any number of circuits from four up. It is absolutely fireproof, and all wire and fuses are covered by porcelain. It can be re-fused in a moment's time and the Peru plug can be used instead of switches. The three-wire board, also equipped with the Peru patent fuse plug, can be built, too, in any number of circuits from four up, and all its fuses and connectors are covered by porcelain. This is very much the same design as the two-wire board, and is absolutely fireproof, and can also be re-fused in a moment's time.

The Peru porcelain transformer fuse plug is a specialty that is well worth investigating. In this fuse-block there is no iron for the current to leak over or jump across. The plug is ventilated for the escape of gas and carries an extra long fuse. The contacts are excellent, and the fuse is easily inserted in the box. The manner of fastening the box to any support as, for instance, a house or a pole, is such as to provide perfect ventilation and insure freedom from moisture.

Another valuable specialty is the Peru covered porcelain mains, represented by the smallest cut in the group. The one shown has a capacity for 10 amperes.



NEW PERU PORCELAIN SPECIALTIES.

Western Union Statement.

The increased use of the telegraphic service by newspapers and the government during the war makes the financial statement of the Western Union Telegraph company for the quarter ended June 30th (estimated) and for the fiscal year of special interest. For the quarter the net revenue increased over 1897 about 15 per cent. Of the increase in net for the year, amounting to $430,000, over half is shown in the present quarter. The quarterly statement is as follows:

	1898.	1897.	Increase.
Net revenue	$1,750,000	$1,509,682	$240,318
Interest on sinking fund	221,450	247,921	*26,471
Balance	1,528,550	1,261,761	266,789
Add sinking fund	....	40,000	*40,000
Balance	1,528,550	1,301,761	226,789
Dividend 1¼ per cent	1,216,980	1,216,967	13
Surplus	[illegible]	84,794	226,776
Previous surplus	[illegible]	[illegible]	167,621
Total surplus	[illegible]	[illegible]	388,400

The statement for the year is as follows:

	1898.	1897.	Increase.
Net revenue	[illegible]	[illegible]	$130,685
Interest on sinking fund	[illegible]	955,501	*28,921
Balance	[illegible]	[illegible]	[illegible]
Dividend 5 per cent	[illegible]	1,792,855	[illegible]
Surplus	[illegible]	[illegible]	[illegible]
Previous surplus	[illegible]	[illegible]	[illegible]
Total surplus	[illegible]	[illegible]	388,400

*Decrease.

The directors have declared the regular quarterly dividend of 1¼ per cent., payable July 15th. The books will be closed June 20th and will be reopened July 1st.

CORRESPONDENCE.

New York Notes.

New York, June 7.—Many well-known eastern electrical men are in Chicago attending the convention of the National Electric Light association. The electrical exhibition here closed on Saturday night. It is said that many of the exhibitors have accepted the offer of the New York State Agricultural society to transport their exhibits to the annual state fair in Syracuse, which will be held in the latter part of August and the early part of September, free of charge, and to give them free space for exhibition. The State Agricultural society recently sent a committee to visit the exhibition in Madison Square Garden, and the committee was so much impressed with the display that it immediately decided to offer such inducements as to make an electrical display a star feature of the fair.

The bogus stock-ticker game, with variations, has been worked again in this city. Henry Summerfield, Peter Williamson and John Burke were held in $1,000 bail each in the Yorkville Court on Saturday, for examination on a technical charge of larceny. Police Captain Kane told Magistrate Flammer that the prisoners conducted a bogus poolroom over a restaurant at 673 Third avenue. They pretended to have tapped the Western Union wires, and by this means to be able to get race-track news 15 minutes ahead of any other poolroom in the city. They let it be understood about the neighborhood that they could give the result of a race in time for a customer to go to a poolroom and bet on a sure thing. The captain said he had one witness who paid $90 for such a "tip," and placed a bet on a horse that came in last. When the detective entered the place on Friday night one of the prisoners had his coat off and was sitting at a table ticking a telegraph instrument connected with a wire which ran up the chimney and which was supposed to be connected with a Western Union wire. Investigation showed that it had no connection with any other wire. Summerfield was said to be the manager of the place. The captain told the magistrate that the manager's picture was in the Rogues' Gallery at police headquarters. The police seized the telegraph instruments and several dry batteries when they made the arrest. Summerfield acknowledged that he owned the property, but denied that he had tapped any wires. He asserted that it was his intention to put in a private telephone wire, in order to get early race-track news from an office downtown. Captain Kane said the men had been in the Third avenue place for about two weeks, and had a dozen men about the neighborhood on the lookout for customers. The prisoners were unable to give bail and were locked up.

Bernard Moebius, the inventor of the electrolytic process of parting and refining gold and silver which bears his name, died on board the Kaiser Wilhelm der Grosse, while on his way to his old home in Germany. Mr. Moebius succeeded in 1884 in solving the problem of economically and rapidly extracting the precious metals from their ores by electricity. He improved his invention in 1895, and now both the old and new processes are in successful operation in Europe, Mexico and the United States. The plants at Frankfurt-am-Main, Perth Amboy, Pittsburg and Denver are the best known, and are described in detail in the leading text-books on metallurgy and electricity. Mr. Moebius was born in Hartha, Saxony, in 1852. He received an academic education and studied chemistry and metallurgy in Germany. He engaged in mining in German, Austria, Spain and Mexico before settling in the United States, of which he became a citizen. He was a leader in his profession, and, though a reserved man, was genial and won many friends. He was a member of numerous scientific associations and of the Arion society of this city.

M. S.

Canadian Intelligence.

Ottawa, Ont., June 6.—A deputation from the city of London, Ont., has been in Ottawa to ask the Dominion government to grant a bonus of $100,000 to aid in the construction of the proposed electric railway from London through Stratford, Arcona and Thedford, connecting with the Canadian Pacific and Grand Trunk railways.

The Eugene F. Phillips Electrical Works of Montreal have been awarded the contract to supply all the trolley, bond and feed wire required in the construction of 25 miles of electric railway at Jamaica, W. I.

The Montreal Cotton company is increasing its power plant, which at present consists of two 400-kilowatt three-phase alternators and 1,000 horse power capacity in induction motors, by the addition of two more 600 horse power generators of the same type and 1,200 horse power in induction motors.

The shareholders of the Hamilton, Grimsby and Beamsville Electric railway of Ontario held their quarterly meeting recently. The quarterly financial statement showed an increase of 10 per cent. in gross earnings over those of the corresponding period last year. The directors were empowered to issue debentures to pay off the floating debt of $20,000. The present debenture debt of the road is $85,000, payable in 30 years.

Mr. Elisha Moore of Meductic, York county, New Brunswick, has invented an alternating switch for street railways, which can be operated from the car by simply pressing a button. The device obviates the necessity of stopping the car and does away with switchmen, which means a great saving to railway companies. Mr. Moore has patented his device, both in Canada and the United States, and will now apply for European patents.

The city engineer of Toronto, Ont., has been negotiating with a company of Buffalo capitalists for the transmission of electric power to Toronto. The company offers to supply electric energy at $40 per horse power per year, if the city guarantees that it will take not less than 10,000 horse power. The company proposes to operate from a point 30 miles nearer Toronto than Niagara Falls.

The British Columbia Electric Railways company of Victoria, B. C., is having installed a complete plant for developing the water power at Goldstream, for operating the street railway and the electric-light plant. The work is being done under contract by Hasson & Hunt, mechanical engineers of San Francisco, Cal., and the plant is expected to be in operation by midsummer. The power house will be stationed at Goldstream, about 12 miles from Victoria. The contracts for the electrical and hydraulic machinery have been closed, and the construction is being pushed with rapidity. The electrical apparatus will be of the Canadian General three-phase type, using rotary converters and transformers to distribute over the line as the two-phase with a voltage capacity of 11,000. Two Pelton water-wheels will be used, with a capacity of 600 horse power each, delivering 1,000 horse power in Victoria. Provision is also being made for 600 additional horse power if required. The power delivered in Victoria will be sufficient to operate the street railway, electric-lighting system, commercial and municipal, and also to furnish considerable power for the operation of stationary motors for manufacturing purposes, elevators, etc.

The Montreal Street Railway company has just had printed 15,000,000 car tickets, the cost of printing being $1,100. The company is said to have received the large sum of $3,000 for the advertisements printed on the tickets.

Mr. Mark Eschwege of Vancouver, B. C., representing a syndicate of French millionaires—the Anglo-French Telegraph company—which has a capitalization of $500,000, has received a cable message ordering him to commence a survey at once for a cable from Vancouver to Dyea, Skaguay and Wrangel. The head office will be at Vancouver, and there will be offices at Victoria, Dyea, Skaguay, Wrangel and Dawson. The cable is now being manufactured in Europe.

The Dominion government has decided to remove the meteorological observatory from Queen's Park, Toronto, owing to the disturbance of the street cars of that city, to Agincourt, some miles distant, where the work of the institution can be effectively carried on. The building to be erected there will consist of a circular stone underground chamber of some 30 feet in diameter, topped by a brick structure for the making of absolute determinations. In the underground room, in profound darkness, only

relieved by two tiny jets of gas, the needles of vertical force, horizontal force and the declinator will make photographic pictures of the earth's magnetic currents. The utmost care will be exercised in its erection, and every stone put into its walls will be tested to ascertain that it contains no iron matter to disturb the delicate working of the magnetic instruments within.

The railway committee of the Privy Council, at Ottawa, has granted a charter to the North Shore Electric Railway company, which proposes to build a railway in the vicinity of Montreal, connecting Montreal with outlying districts. This road will run from Three Rivers, Que., along the north shore of the St. Lawrence. The promoters of this enterprise intend to use the water power of Shewanegan Falls for the generation of the necessary power wherewith to operate the road.

The Montreal and Southern Counties Railway company, which obtained its charter last year, has been given power by the railway committee to extend its operations to the counties of Beauharnois, Chateauguay, Huntingdon and Napierville, Que. The company is given powers for connecting with other railway companies or crossing the St. Lawrence, and for amalgamating with other companies, but the company is debarred from running along the streets of Montreal or the adjoining municipalities. Powers are also given to run steamers, maintain pleasure grounds and sell electricity for light, heat or power.

The Cataract Power company of Hamilton, Ont., is engaged on an immense undertaking in the county of Welland, Ont., for the purpose of creating electricity on a large scale with a view of supplying power to every business industry that may require it in its line of route of upwards of 40 miles. At the De Cew Falls a very large reservoir is in course of construction, the water for which will be supplied from the Welland Canal at Allanburg, which is itself fed from Lake Erie, and which stands at a considerable elevation above the site of the new reservoir. Seven or eight other storage reservoirs are being made between De Cew Falls and Allanburg, so as to have an abundant supply of water always on hand. At the De Cew Falls a large power house has been erected and the water will be carried from the reservoir through pipes 12 feet long by eight feet in diameter, the fall from the reservoir to the power house in the valley below being about 100 feet. The company proposes to sell the electricity all along the route of 40 miles to Hamilton, for electric lighting or motors for manufacturing purposes, and will be prepared to increase the power at any time it may be required. The work is being done by contract, and at the De Cew Falls end there are some 200 men at work, with about 100 teams of horses, working excavators, etc. The job is to cost $1,000,000. The work has been going on for about eight months, and is expected to be completed some time in the coming fall.

Mr. Peter Trudeau of Ottawa, inventor of the electric heater controlled by the Dominion Electric Heating and Supply company of this city, visited Philadelphia recently to give an exhibition of the capacity of his heater. Mr. Hewitt, engineer of the Union Traction company of that city, conducted the tests as against the best heaters now in use in the United States. Mr. Hewitt's official report, just received, declares that the results indicate that the Ottawa heater is the most economical in the use of electrical energy at the temperature maintained. The only question to be settled to determine the sale of the right to manufacture the Ottawa invention in the United States for a considerable sum of money, is the durability of the heater. The heaters have now been in use for two years in the Lachine power house, and show no symptoms of wear, though the copper resistance has been kept at a red heat for months.

A. V. W.

PERSONAL.

Mr. R. J. Randolph, formerly western manager for the Excelsior Electric company, has gone to New York, to become general sales manager of the Sterling Arc Lamp company.

J. J. Schoenleber, manager of the Northwest Engineering company of St. Paul, was in Chicago this week on his way home. Mr. Schoenleber has been enjoying a well-earned vacation.

ELECTRIC LIGHTING.

The park commissioners of San Francisco are preparing extensive plans for the improvement of Golden Gate Park. It is proposed to expend $9,500 for electric lighting. In addition to this, $6,500 is estimated as the cost of extending the electric lights to the beach.

The Bulletin des Usines Electriques, in an article discussing the question of extending the time of the concession for lighting Paris, gives a few interesting details about electric lighting in Berlin. It says that there are 300,000 incandescent lamps of 16 candle power connected, besides several thousand arc lamps. The length of mains is about 186 miles, and the power developed is about 28,000 horse power. There are also 1,600 motors, taking 6,450 horse power. The price of current for lighting is 15 cents per kilowatt-hour, for power four cents. Paris will require about 25,000 horse power. It is proposed to complete a system comprising 418,000 incandescent lamps of 10 candle power and 7,448 arc lamps, and about 240 miles of mains. There will be 513 motors requiring 1,940 horse power, and the cost will be about 23 cents per kilowatt-hour.

Electric lighting, especially for household purposes, is rapidly progressing in Egypt. It is offered at cheap rates, and is far preferable in the Egyptian climate, to the very ordinary quality of gas supplied by the gas company in Cairo, which has been granted a concession to supply electric light. Only two trains on the government railway are at present equipped with electric lights. The gas company mentioned has engaged to light all Cairo by electricity in lieu of gas, and it is confidently expected that Alexandria will soon adopt the same method.

ELECTRIC RAILWAYS.

Oscar T. Weber filed a petition, June 2d, with the supervisors of San Francisco for a franchise for a street railway commencing at the junction of Fillmore and Francisco streets, extending along Francisco to Jefferson, thence along Jefferson to the Presidio Reservation.

A 50-year franchise has been granted the Geneva Lake, Sycamore and Southern Electric Railway company for a line to run from Geneva Lake, Wis., to Morris, Ill. The road is to be a single track of uniform gauge of four feet 8½ inches, and the rails to be used are to be the uniform T-rail of 45 pounds weight per yard. The road is to carry passengers, mail, express and freight, and its general office will be located at Sycamore. The length of the proposed road is 110 miles, and it crosses 10 lines of roads, nine of which lead to Chicago, one connecting with Milwaukee. The president of the company is James Branen; secretary, George B. Morris; treasurer, George Brown; general manager and promoter, John B. Whalen; directors, A. K. Bunker, John R. Kellogg, Emil Arnold of Woodstock, A. G. Whilte, S. Baker of Sandwich, H. F. Jones of Hebron, D. S. Brown of Genoa, P. T. Parkhurst, Loren Woodard and F. W. Patrick of Marengo, Edward Delany of Cortland, and the officers. The company was incorporated January 13, 1898.

POWER TRANSMISSION.

The Edison Electric company of Los Angeles, Cal., has obtained control of the Southern California Power company of Redlands, and the two corporations have been practically consolidated, with headquarters in Los Angeles.

Notice is given that an application for franchise to erect poles and wires for transmission of electric power and for lighting purposes at Antioch, Cal., has been made by W. C. Myers, and bids for the franchise will be received by the city clerk up to 10 a. m., July 5th.

According to the Auburn, Cal., Herald of May 28th, it is reported that the South Yuba company is preparing to put in another powder plant to be located on the ground of the present electric-light works. This new plant will be auxiliary to the one at Newcastle, and the power will be utilized at Sacramento.

The Kern-Rand company—one of the comparatively large number of electrical water-power transmission companies in California—will generate about 2,000 horse power at its plant on the south fork of the Kern River for transmission to Randsburg and the desert mines. Water will also be supplied for irrigation.

The San Gabriel Electric company has nearly completed its work of establishing a great electric plant in the San Gabriel Cañon, by which electric power is to be transmitted over seven copper wires to Los Angeles, Cal., 22 miles from the mouth of the cañon. It is expected that the line will be completed by the latter part of this month, and its ultimate capacity will be 3,500 horse power delivered, after deducting all losses in transmission. On the pipe line there are no less than 38 tunnels, aggregating 22,000 feet in length.

The Azusa (Cal.) Pomotropic states that some of the projected electric-power systems are liable to prove a menace to irrigation, as they seek to gather a number of small mountain streams from their natural courses into pipes, thus leaving the canons through which they flow without water, in which case a large amount of vegetation must die, and thus tend to the denudation of the mountains and the diminishing of the water supply. It is claimed that the government should grant no privileges on reservations without first making careful inquiries into the effect of the proposed works on irrigation rights.

TELEGRAPH.

In London there is a lodge of Freemasons known as the Telegraph Cable Lodge. At a recent meeting W. O. Smith was elected master, succeeding O. Moll of the Direct United States Cable company.

A 7,000-ton telegraph cable-laying ship is now in course of construction at Barrow, England.

The New York Sun recalls that the cable dispatch sent by Secretary Seward to the French government at the close of the Civil War, announcing that Mexico must be evacuated by foreign troops, cost $15,000. The cable service was in its infancy, and communication through it was very costly. Secretary Seward did not economize his words, but talked as fluently and went into as many details as though he were seated at a table opposite the French minister of foreign affairs. The dispatch resulted in the withdrawal of the French troops, and this led directly to Maximilian's tragic death at Queretaro in June, 1867.

ELECTRICAL SECURITIES.

For the first quarter of the present year the Westchester Electric Railway company earned gross $25,361, an increase of $1,031, and net $4,154, an increase of $1,276. The general balance sheet shows cash on hand $1,599 and a deficiency of $9,177.

The New Orleans Traction company reports gross earnings for April of $109,065, an increase of $5,075 as compared with the same month of last year, and net $44,713, an increase of $7,533. For the four months ended April 30th, the gross earnings were $441,440, an increase of $19,763, as compared with the corresponding period of last year, and net $186,418, an increase of $37,872.

There was a phenomenal advance of 20 points in the price of Chicago City railway stock on Saturday, June 4th. The market for the stock was a repetition of that on Saturday, three weeks ago, when the price suddenly jumped from 235 to 250 on buying of a few hundred shares. Since then it fluctuated between 245 and 250, and closed at the latter figure June 3d. The following day it opened at 255, at which a 100-share lot changed hands. The next sale was of 10 shares at 260. Then seven shares brought 265, and the next and final sale was of 12 shares at 270. At the close the biggest buyer on the advance bid 270 for any part of 5,000 shares. At 270 the 12 per cent. dividend of the company is equal to 4.44, but the company really earned in 1897 5.09 per cent. on its capital stock, figuring its value on a basis of $270 per share, and this year the earnings of the property have shown good increases.

MISCELLANEOUS.

A telegram just received in Chicago states that the patent of the H. B. Camp company of Aultman, O., on the mandrel for manufacturing conduit ducts has been sustained.

Lieut. W. D. Weaver, editor of the American Electrician, has received his commission as passed assistant engineer in the United States Navy, with the rank of lieutenant, and has been assigned to one of the monitors.

The Navy Department will shortly install a number of electrical machines in the New York navy yard, and for that purpose is inviting sealed proposals until June 28th, for furnishing the following electrical equipment: One 100-kilowatt, 125-volt generator; six two horse power, 110-volt, enclosed, portable motors; two five horse power motors, two 10 horse power motors and one 20 horse power motor. Deliveries are to be made within 60 days after date of contract. Prospective bidders can obtain specifications and blank forms of proposals upon application to the Navy Pay Office, New York, or to the Bureau of Supplies and Accounts, Washington, D. C.

TRADE NEWS.

The Attica Electric Light company, Attica, Ind., is increasing its plant by the addition of a 125 horse power Ball engine, built by the Ball Engine company, Erie, Pa.

As Mr. E. R. Mason, in charge of the Chicago office of the Mason Electric Equipment company, has been called into active service as a member of the naval militia, it is requested that, for the present, all orders be sent to the St. Louis office of the company, 314 Security building. Mr. E. R. Mason is a son of Mr. W. R. Mason, who has another son in the naval militia. It is to be hoped that the company will lose nothing by the patriotism of the young men.

The K & W. company of Pittsfield, Mass., manufacturer of the Hardy incandescent lamp, reports fine trade. The Hardy lamp has a deserved popularity among central-station men who consider quality and sustained candle power and efficiency in their lamps. The company's trade in arc hanger-boards, dynamo brushes and commutator compound has been the largest since the organization of the company. Meysenburg & Badt, 1504 Monadnock building, Chicago, are the western representatives of the company.

The Bryant Electric company of Bridgeport, Conn., is erecting a new two-story power house, 50 feet square. The building has brick side walls and the framework is of the steel skeleton type. The floor of the building is supported on heavy girders and columns, which carry steel joists supporting corrugated iron arches and concrete floor. The roof has clear span trusses carrying corrugated iron covering, lined with patent anti-condensation roof lining, which prevents the condensation of moisture on the under side of the roof covering and avoid any damage or inconvenience from moisture dropping on the delicate machinery or material on the floor below. This building was designed and th

steel material furnished and erected by the Berlin Iron Bridge company of East Berlin, Conn.

BUSINESS.

Bulletin 4-F of the Western Electric company relates to alternating-current ceiling and desk fan motors. Descriptions and prices are given.

Paragon fan motors are listed in a leaflet issued by the Chicago Edison company. Prices, dimensions, capacity and style of finish are given for wall, bracket, duplex and desk fans.

Roth Bros. & Co., Chicago, are placing on the market the well-known Roth fan motors, for which the demand is constantly increasing. The Roth company calls attention to the prices on these goods.

The Central Manufacturing company, Chattanooga, Tenn., is kept busy filling orders for yellow pine cross-arms, oak and locust insulator pins and brackets, which are coming in from all parts of the United States. Its goods are giving satisfaction to all those who use them.

M. B. Austin, western manager for the Safety Insulated Wire and Cable company, has taken as a partner W. A. Browne, and hereafter the firm will be known as M. B. Austin & Co. Mr. Browne, for number of years, was in the coal business. In the new firm Mr. Browne will attend more particularly to office affairs, while Mr. Austin will continue to handle the company's outside affairs.

The Central Electric company of Chicago reports a brisk trade in Westinghouse alternating-current fan motors. One reason for this is undoubtedly the fact that the company is carrying large quantities in Chicago stock, and hot orders in hot weather can be filled immediately. The Central company has also a number of new specialties in its house-goods department, prominent among the number being a new device for electrically lighting the incandescent gas or Welsbach burner. This is a very simple device, and will doubtless be appreciated by those who have been asking for a device of this character.

The St. Louis Electrical Supply company recently sent out a very novel and interesting postal card as an advance notice for its salesmen. While it is impossible to go into the design in detail, it may be said that it is based upon the expression "We will play ball in your town about — date, with the salesman at the bat, and Packard incandescent lamps, O. K. weatherproof wire, and telephone goods respectively on the first, second and third bases, Emerson fan motors right field, Western Electric direct-current fan motors center field, lightning arresters shortstop, with Bryant porcelain goods for catcher." This little specialty will, without doubt, help the company's salesmen.

In making soldered connections on telephone switchboards and elsewhere in telephone work, when it becomes necessary to solder wires of small diameter, it is very essential to have a high-grade soldering flux. A soldering flux which will not injure the wire in any way and at the same time will make a quick and sure joint is very much to be desired. The Electric Appliance company claims that it has something which fills all of these requirements in its Highland soldering paste, which is now being used very largely for telephone work and for fine instrument work generally. The company is giving customers an opportunity to test this paste by sending free of expense small sample boxes.

The W. R. Garton company of Chicago, which succeeds W. R. Garton, has recently moved into handsome and commodious quarters, 807 Ashland block, where as consulting engineers and manufacturing agents the members of the company are admirably situated to promptly meet the demands of street railways, electric-light and power companies, as well as to vigorously push their line of new agencies. This company represents some of the largest and most reputable manufacturers in the country, as evidenced from the list: The Central Union Brass company, Keystone Electrical Instrument company, Crouse-Hinds Electric company, Duquesne Forge company, Pittsburg Steel Hollow-ware company, Massachusetts Chemical company, Billings & Spencer company, Raster carbon rheostats, Garton lightning arresters, Liberty Lamp company, William E. Klein & Co., C. S. Knowles, Bound Brook trolley bushings, Pittsburg trolley poles and Morrell's commutator bars. The company reports that business is exceedingly good. It reports having closed several large contracts for Raster carbon rheostats, as well as having had a splendid business in Keystone electrical instruments, Garton lightning arresters, Billings & Spencer drop-forged commutator bars, etc. This company carries in Chicago a large stock of wire and cables and all kinds of tape. It will also make a specialty of the calibration and repairing of instruments.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued May 31, 1898

604,712. Electrical Signaling System and Apparatus. Walter F. Banks, Milford, Conn. Application filed October 1, 1896.

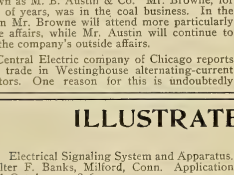
The mechanism employed includes signal wheels, circuit controllers, a switch-lever for putting one or the other of the circuit controllers into the line, and a short-circuiting lever for short-circuiting the circuit controllers, and a spring connecting the short-circuiting lever and the switch lever.

604,729. Elevated Electric Car Line. Joe H. Cooley, Paris, Texas. Application filed August 13, 1897.

Features of construction embodied in this plan include a single line of posts with cross-beams attached, braces, supporting girders and cross beams, in like manner cross ties supporting a single rail for car-wheel groove, a system of vertical and longitudinal frame work supporting two upper rails for each track, upper cross-beams attached to posts supporting electric wire supports.

604,747. Electric Railway. John H. Guest, Boston, Mass. Application filed October 20, 1896.

A switch-operating magnet has spool heads fitted into a containing tube having a seal at its end through which permanent magnet connections pass and in which they are hermetically sealed.



NO. 604,729

604,770. Pneumatic Atachment for Telegraph Keys. William J. Lieb, Pratt, Minn. Application filed April 15, 1897.

A pneumatic attachment for telegraph keys is described comprising an outer wall, a diaphragm, means for securing the device to a key botton, and a tube leading into an air chamber formed by the outer wall and the diaphragm

604,806. Electrical Belt. Andrew J. Taylor, Vineland, N. J. Application filed April 12, 1898.

An electro-galvanic belt consisting of a sheath, hook plates attached thereto, a battery detachably connected to the hook plate within the sheath, and battery electrodes arranged outside of the sheath and having a hinged connection with the sheath and electrical connection with the hook plates in the battery

604,842. Electric Motor or Dynamo. Andrew L. Riker, New York, N. Y. Application filed November 24, 1897

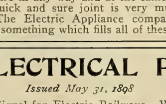
An armature frame is described comprising a spider having radial arms grooved longitudinally in their outer surfaces, [illegible] surrounding and supported by the spider and provided in their inner edges with cuts corresponding to the grooves, end plates [illegible] provided with bolt holes, and fastenings [illegible] the arms and rings.

604,843. Former for Winding Armature Coils. Andrew L. Riker, New York, N. Y. Application filed November 19, 1897

A coiling frame is the principal feature comprising two parts having a winding space between them, and grooves or winding channels in each part transverse to the plane of the winding space, those in one part being on the face of the former and those in the other part in the rear thereof.

604,866. Signal for Electric Railways. William H. Jordan, Brooklyn, N. Y. Application filed February 16, 1897.

One claim is given: In an electric railway, the combination with the main or working conductors of two electromagnets for controlling a signal, said magnets being independently connected between one of the main or working conductors and two distant contact plates located in close proximity to the same conductor, and which contact plates are adapted to be electrically and successively connected with the other main or working conductor through the contact devices and circuit connections of a moving vehicle.



NO. 604,749

604,874. Safety Device for Electric Carriages. Reginald T. D. Brougham and Walter C. Bersey, London, England. Application filed December 13, 1897.

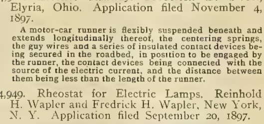
The combination is claimed of a closed box, a keyhole leading into the box, two open contacts within the box remote from the keyhole and connected to the circuit wires and a key so shaped that it passes through the keyhole and when the key is turned connects the contacts.

604,911. Electric Railway. Frederick D. Sweet, Elyria, Ohio. Application filed November 4, 1897.

A motor-car runner is flexibly suspended beneath and extends longitudinally thereof, the centering springs, the guy wires and a series of insulated contact devices being secured in the roadbed, in position to be engaged by the runner, the contact devices being connected with the source of the electric current, and the distance between them being less than the length of the runner.

604,949. Rheostat for Electric Lamps. Reinhold H. Wapler and Fredrick H. Wapler, New York, N. Y. Application filed September 20, 1897.

In combination with the ordinary incandescent electric lamp it is proposed to employ two heads of insulating material, a socket connection upon one head for the incandescent lamp, and a socket connection on the other head for the socket or electric lamp fixture, a rheostat coil between the insulating heads, a bar also between the heads, a sliding contact in the electric circuit and upon the bar and resting upon the rheostat coil and having a knob or head by which it is adapted to be moved toward one head or the other for varying the resistance in the lamp circuit, and a casing of sheet metal multiperforated and surrounding the rheostat and bar to protect the same and allow a free circulation of air, the casing being slotted for the knob or head of the sliding contact.



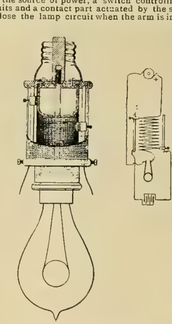
NO. 604,842.

604,968. Automatic Current Distributer for Electric Railways. Jean Claret and Olivier Vuilleumier, Paris, France. Application filed May 4, 1897. Patented in France June 8, 1895, and November 18, 1895; in Germany November 27, 1895; in Switzerland December 2, 1895, and in Spain February 4, 1896.

A distributer for an electric railway having a series of switches to be connected to the spaced contacts of the railway contact arms, to contact with the switches, the spacing of the axes of these contact arms being less than the spacing of the axes of the switches, and an electric motor to move the arms, the motor armature having a commutator provided with fingers electrically connected with the coils of the electromagnets of the motor, and contacts for the fingers electrically connected with the arms.

605,013. Switching Device and Circuit Arrangement for Electrically Propelled Vehicles. Emil B. W. Reichel, Berlin, Germany. Application filed January 10, 1898.

This circuit arrangement for electrically actuated vehicles consists of motor, accumulator and lamp circuits, a switching or trolley arm adapted to be connected with an external source of power and the motor circuit, a contact piece connected therewith, a contact part adapted to be engaged by the contact piece and insure the electrical continuity of the remaining circuits when the arm is connected with the source of power, a switch controlling these two circuits and a contact part actuated by the switching arm to close the lamp circuit when the arm is in a position of rest.



NO. 604,949.

605,023. Electric Switch for Use with Electrically Propelled Vehicles or Locomotives, Etc. Albion T. Snell and Charles E. Grove, London, England. Application filed October 8, 1897.

A compound switch comprises among its members a starting switch and a controlling switch for coupling the motors in different relations, and mechanism for imparting an intermittent movement to the controlling switch from the starting switch.

605,026. Globe for Incandescent Lamps. Victor de Spruner-Mertz, Brussels, Belgium. Application filed November 18, 1897. Patented in Germany July 30, 1896.

A lamp globe is formed of transparent material and consists of a double conical portion truncated at one end, a narrow conical portion, and an intermediate bulging and annular portion integrally connecting the two first-named portions, the walls of the truncated member of the double conical portion and the conical portion being lined with reflecting material and being substantially parallel and the source of light being adapted to be situated between the annular portion and the extreme end or tip of the globe.

605,066. Third-rail Underground Electric-railway System. Louis E. Walkins, Springfield, Mass. Application filed August 21, 1897.

The system employs a rail conductor, a trolley or shoe having terminals or binding posts, a holder plate for the shoe, on which the same is vertically yieldingly supported, arms for the holder plate, whereby the same may be supported from the motor car or truck, and wires running to connection with the binding posts of the shoe, independent of the holder plate and its supporting arms.

Western Electrician.
EVERY SATURDAY.
Vol. XXII. CHICAGO, JUNE 18, 1898. No. 25

Northwestern Electrical Association.

The midsummer meeting of the Northwestern Electrical association, as announced last week, attracted a large number of central-station men and manufacturers who had been in attendance at the Chicago convention of the National Electric Light association, and when the magnificent steamer Northwest left the dock on Friday afternoon, June 10th, it carried many prominent electrical men from all parts of the country.

The start was made between the showers that visited this city last week, and although there was a violent storm during the afternoon, no ill effects were felt by the convention party, and, aside from the disappointment of being compelled to remain under shelter, there was really no inconvenience experienced. It merely afforded an opportunity to prove the excellent seagoing qualities of the boat.

When the steamer arrived at Milwaukee it was greeted by a large delegation of electrical people and their friends. Several joined the party at this point and the boat then proceeded on the route outlined in the Western Electrician of June 4th.

Convention Proceedings.

The convention was called to order at 8 p. m. for the purpose of arranging a programme. The secretary announced that stops would be made at Mackinac, the Soo and at Houghton, and that it was expected the steamer would reach Duluth on Monday night, June 13th. He added that there would be a reception tendered the members of the association at Sault Ste. Marie, and that an inspection of the government canal had been especially arranged for the benefit of the members of the association, that a stop would also be made at Houghton long enough to permit of a visit to the famous copper mines there, and that suitable arrangements had been made for the entertainment of the members and visitors.

Professor Ichisuke Fujioka of Tokyo, Japan, was introduced. He promised to address the convention on the subject of the "Electrical Industry in Japan," adding some comments on the subject of electrical education there.

It was announced that Professor Elisha Gray of Highland Park would deliver an address during the convention, at an early session.

The secretary announced also that an address would be delivered by A. J. Wurts of Pittsburg during the trip, and that other addresses would be announced later.

Announcement was made that W. F. Barker, gas commissioner of Massachusetts, would also deliver an address.

Arrangements were made to place a question box in position to receive queries for consideration and discussion during the sessions.

An adjournment was then taken until June 11th at 11 a. m.

The second session of the convention was called to order by the president, F. A. Copeland, who introduced S. Everett Doane of Marlboro, Mass., the author of a paper on "Incandescent Lamps," after the reading of which a vote of thanks was extended to Mr. Doane. During the reading of his paper Mr. Doane called attention to the fact that the old theory that the evaporation of carbon and condensation on the bulb of the lamp was the cause of blackening had been exploded, and that the generally received theory at present, which was undoubtedly correct, was that the blackening is a truly chemical effect.

The question box was then opened by the secretary and found to contain the following questions:

The first question is: "Would like to know the experience of any central stations represented having competition from isolated acetylene gas or isolated gasoline plants."

The second question is: "What success has been realized in substituting an incandescent lamp in place of wire resistance in direct current enclosed arc lamps?"

J. W. Mabbs, Chicago: I have had a little experience in the line suggested by question No 2. Some two or three years ago I conceived the idea that the resistance in an incandescent lamp was wasting a great deal of energy which ought to be utilized as light, and I tried quite a number of experiments, by taking incandescent lamps and putting them in multiple series with the incandescent arc. I had quite a little trouble to get the incandescent lamps to work satisfactorily, owing to their faulty construction, but after a little we got the thing down so that the lamps worked pretty well. The arc lamps worked much better than they did with the metal resistance, and the smaller lamps gave more or less light that we utilized for places where a little aberration in light would not be objectionable, and in that way put the energy formerly thrown away to good use in lighting spaces where a variable light would not be objectionable. During the two or three years that we have used the incandescent lamps in connection with the arc lamps, in this way, we have been put to less trouble and expense for repairs than when we used the lamps with the metal resistance. By putting about six lamps of 10 candle power in multiple series, each one consuming about an ampere, we get very good results.

Mr. Harding: The better service that you obtain from your arcs, I presume, is due to you having less trouble in maintaining the lamp.

Mr. Mabbs: Yes, sir. I think the main benefit derived is in having the heat from the resistance kept away from the lamp. The insulation is injured by the resistance in the lamp, and by putting this resistance in incandescent lamps it removes the heat from the arc lamp, and in that way lengthens the life of the arc lamp.

Mr. Wurts: Does the breakage of one of the lamps render them all useless?

Mr. Mabbs: We use about four watts in these lamps, and in that way we figure that five lamps will carry the current necessary to run the arc lamp and we keep close enough watch of them so that if one burns out we replace it immediately, and in that way avoid the loss the of the entire lot. If two burn out, however, generally the whole lot goes.

Mr. Wurts: How many have you been operating in that way?

Mr. Mabbs: About eight or 10. The reason that we have not used more in that way is because the light derived from the incandescent lamps will fluctuate considerably for instance, a 10 candle power lamp ranges from 8½ to 12 candle power which would be quite objectionable where a continuous light is needed. But for lighting pa-

NORTHWESTERN ELECTRICAL ASSOCIATION — TOURING PARTY IN DULUTH

sages, and, in fact, for all lighting purposes where variation in candle power is not objectionable, this method of lighting can be used. The method described, however, is impracticable where steady reading or writing is concerned.

Mr. Abadie: What is the maximum distance from the arc lamp at which you can place the incandescent lamps?

Mr. Mabbs: Fifty or 60 feet.

Mr. Kimball: Although I am not a member of your association, I might say that in Hartford, Conn., they have been making extended experiments in this line, and have adopted a special form of series lamp, giving it in the form of a bonus to customers. It is installed in stairways, entries and places of that description, and it has been very successful. I think they have it in operation now on about 50 lamps. They have been operating that number to decide whether the method is practicable, and, if so, they will put it in operation over the whole of their system.

Mr. W. F. Barker, gas commissioner of Massachusetts, was introduced by the president, and responded by explaining the condition of quasi-public corporations in New England.

Mr. Hill announced that as the steamer was late it would hardly be possible to go on shore and still keep an appointment at Sault Ste. Marie. A reception had been prepared at the latter place, and an invitation had been extended to inspect the new smelting furnaces there.

Mr. Abadie suggested that a committee of three be appointed to determine the matter, and Messrs. Mercein, Hill and Abadie were appointed as a committee.

On Monday a paper by Walter B. Snow of Boston on the subject of "Mechanical Draft" was then read by Mr. Cross, in the absence of the writer of the paper. The subject was freely discussed by Mr.

NORTHWESTERN ELECTRICAL ASSOCIATION.—DEPARTURE FROM CHICAGO ON STEAMER NORTHWEST.

Doherty of Madison and Mr. Dow of Midland. Mr. Cross also made a few remarks on the subject.

Mr. Dow of Midland, Mich., read an interesting paper on "Purification of Water."

An address by A. J. Wurts of Pittsburg on "Lightning Arresters" was another interesting feature.

This was the last meeting on the boat, and when it was concluded the convention adjourned "to the city hall at Duluth on June 14th at 10 a. m." When the convention met again the members were welcomed by the mayor of Duluth, and a response was made by President Copeland on behalf of the association. The paper by William Smith Horry on "Electric Smelting of Ores" was read by Mr. Doherty. Accompanying the paper were photographs of the rotary furnace as used for making carbide of calcium, samples of ferro-nickel 40 per cent. pure, and of iron containing seven per cent. of nickel.

The secretary announced that the following question had been put into the box: "On an overhead three-wire system of direct low-tension distribution, does it afford additional protection against lightning to ground the neutral wire at various points throughout the system?"

The president requested Mr. Wurts to give his opinion on the matter.

Mr. Wurts said: "In my judgment, the grounding of the middle wire might, and probably would, protect the generator. But I do not think that the grounding of a wire protects apparatus at any considerable distance from the point at which the wire is grounded. The self-induction of the wire, that is, the tendency of a perfectly straight wire to the passage of impulse discharges, is so great that the discharge must travel any considerable distance over the straight wire to get to a perfect ground; it will much as preference to doing that. I have seen that in practice very often and have demonstrated the fact in laboratory experiments. I have shot a current, or made a loop of wire, for instance, take a wire running from my position here to the corner of the room and back again, and place a spark gap half way between here and the corner, and disruptive discharges into the wire, and the current will pass across the spark-gap rather than go through the wire and back again. That amounts to the same thing as grounded wire, and, as I say, in preference to traveling the wire, the current will jump a considerable spark-gap."

The president asked, "What effect do you think the grounding of the neutral has on the chances of lightning entering buildings? Is it as liable to enter the house if the neutral is grounded as when it is not grounded?"

Mr. Wurts: Where will that neutral wire be grounded?

The president: Anywhere—wherever you can find a hydrant.

Mr. Wurts: If that wire is grounded as it enters the house in that neighborhood, I think it should very materially protect the apparatus in the house. What I was thinking about was, if that neutral wire was grounded at the station only, it would not protect the apparatus in the house. If you ground it at frequent intervals, I think it will protect any apparatus in its neighborhood.

The president: Do you think a dwelling is as safe from lightning with the neutral grounded as it is without?

Mr. Wurts: It is safe from disruptive discharges from that wire, but how about the other two wires? I do not think that that relieves the other two wires of the necessity for lightning arresters.

The president: Of course lightning arresters must be put on the other two wires, but I wanted to know if it was bad practice to ground the neutral wire.

Mr. Wurts: No; it is not; in reference to lightning, it is good practice, I think, and would relieve the necessity of placing lightning arresters on the neutral wire, but not of placing lightning arresters on the other two wires.

Mr. Dee: I would like to ask Mr. Wurts what his opinion is of the protection to long lines, where, we will say, barbed wire is strung on the pole above the other wires. This, I understand, has been done between Niagara Falls and Buffalo, and has no connection with lightning arresters at the station, but the barbed wire is grounded at different points along the route. At our plant we have some long lines, and we thought that possibly there might be some protection to the system generally if a similar arrangement were adopted.

Mr. Wurts: I think that overhead wire would make a very good ground wire—no question about that—but it is not my opinion that it is a valuable protection to overhead wires from lightning.

Mr. Dee: It has occurred to me that the lightning is just as apt to strike the charged wire as it is the other. I might say also that the telegraph engineers use something of this character between Buffalo and Chicago. The Western Union and Postal people put grounds on every 10 or 15 poles, with just simply the point of the iron wire going above the telegraph pole.

Mr. Wurts: I think there is a great deal of this protection needed for telegraph poles. In Illinois I have counted 10 to 20 consecutive poles struck by lightning; and that is the object of the wire running up above the pole, to protect the pole, and not the wire; and I don't know of a single case where an overhead grounded wire has been struck by a lightning discharge.

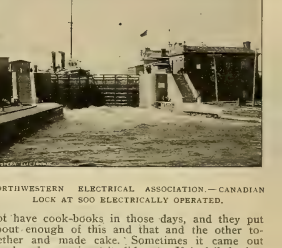
The president: Do you think that the barbed wire has any particular advantage over a plain wire?

Mr. Wurts: I think it has, if it is going to drain the charge from the atmosphere. Points, we know, drain electrical charges much more readily than smooth bodies. We know that in a static machine, if we have no points on the terminals we cannot generate pressure at all, and I have no doubt that if the overhead grounded wire is of any value, that the additional points would considerably increase its value.

Mr. Pierce: I know of a case where the wires from a dynamo were all underground, and ran down 300 or 400 feet underground. These wires were struck by lightning. The arresters were blistered, and that was the only thing that happened, which indicates that when lightning strikes wires it does not rip things all to pieces.

The secretary: This association has been honored during this trip by one of the shining lights of his profession. It gives me great pleasure to introduce Professor Elisha Gray of Highland Park, Ill.

Professor Gray: When I began my career as a so-called electrician, there was no science in electricity. We knew nothing about ohms, amperes or volts, or any of those other peculiar terms which have grown up as the science has progressed. We had to do our experimenting just about as our mothers used to make cake. You know they did

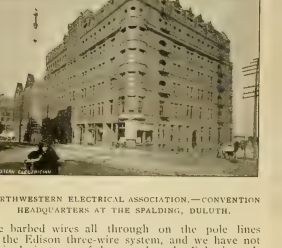


NORTHWESTERN ELECTRICAL ASSOCIATION.—CANADIAN LOCK AT SOO ELECTRICALLY OPERATED.

not have cook-books in those days, and they put about enough of this and that and the other together and made cake. Sometimes it came out good and sometimes it did not. If it failed, they did not know why it failed, and if it was a success they did not exactly know why that was either. That is about the way we had to conduct our experiments. We knew nothing about the relations of wires to magnets, resistance, etc. I remember when the first rheostat came into this country. It was a Varley rheostat with a differential galvanometer, and Charles H. Summers of Chicago, electrician of the Western Union, had the first one. He used to carry it under his arm, and he was a great man. That was the beginning of ohms in this country—the beginning of the measurement of resistances.

The secretary: The association is also fortunate in having with it one of the natives of that charming island empire, the delightful land of the chrysanthemum. It gives me great pleasure to introduce to you Professor Ichisuke Fujioka, of the Imperial University of Tokyo, Japan.

Professor Fujioka: I intended to give you a short account of what has been going on in Japan in the way of technical education, particularly electrical engineering, but I have seen so many interesting things and have got so much useful information on this trip, that the things which occupied my brain have been crowded out. I might take this opportunity to say a few words about lightning, which is the topic of this morning's meeting. We



NORTHWESTERN ELECTRICAL ASSOCIATION.—CONVENTION HEADQUARTERS AT THE SPALDING, DULUTH.

use barbed wires all through on the pole lines in the Edison three-wire system, and we have not a single instance of damage done by lightning, although our country is very often visited by thunderstorms of great energy. Thus far, many of the so-called lightning arresters have failed to give satisfaction in Japan, and I perfectly agree with Mr. Wurts as to the way in which the long-distance transmission line should be protected.

I wish to add a word regarding the feeling in Japan toward America. It is quite friendly, and, in my opinion, the development of the electrical engineering industry in general is mainly due to the efforts of American inventors and engineers. We are using Morse instruments almost exclusively on telegraph lines in Japan, and we use Western Electric switchboards on all telephone exchanges and Edison and Brush machines in lighting. That shows that the so-called alliance of the United

States, Great Britain and Japan is already accomplished, as far as we are concerned.

Resolution of Thanks.

Mr. Doherty: The convention is under obligations to many for our entertainment, and I desire to offer the following resolution, and move its adoption:

"Resolved, That in appreciation of the magnificence of the palatial floating home which has transported us from Chicago to Duluth, and the extraordinarily courteous treatment accorded us by the officers of the company, we desire to express to them our gratification and to extend to them our most sincere thanks. To anyone wishing an exceedingly pleasant trip, an elegantly appointed boat and kind, courteous gentlemen to deal with, we can gladly testify in favor of the Northwest and the officers of both the company and the boat."

The resolution was unanimously carried.

whether it was advisable to stop at Mackinac, but it was finally concluded that owing to the fact that Sault Ste. Marie had planned a special entertainment for the party and that navigation would be difficult during the remainder of the voyage, a stop of great duration would not be made. A good view of Mackinac, however, was obtained as the vessel ran into dock. A stop of a few minutes was finally made to give the delegates a glimpse of the beauties of this well-known resort. After leaving Mackinac the day was spent in contests among the ladies and gentlemen at quoits and shuffleboard. A prize had been offered by the Libbey Glass Works, to be competed for by the ladies at shuffleboard. This prize was won by Mrs. H. G. Underwood.

On approaching Sault Ste. Marie a tug came out to meet the Northwest, containing a committee from that city appointed to welcome the vessel, and amid much whistling and acclamation from the large crowd on the docks, the landing was made. The

in which he expressed the hope that he would be able to welcome the association to Japan, where he hoped it would stop on the way to some future convention to be held at Manila.

Mr. Hurst and Judge Johnson of the Canadian Sault welcomed the convention in behalf of Canada, and alluded to the present prospect of an era of good feeling between the English and American people.

President Copeland spoke for the association and Secretary Mercein read letters of regret from Mr. Edison and others.

Sunday morning the party, in charge of Mr. Clerque, was taken on board a tug to the Canadian side, visiting the locks, the immense pulpmill and Mr. Clerque's famous blockhouse, where an entertainment had been provided in the way of a luncheon. On returning the entire party was photographed on the bow of the Northwest.

Sunday night's entertainment consisted of a piano

NORTHWESTERN ELECTRICAL ASSOCIATION.—VIEW OF DULUTH HARBOR FROM STEAMER NORTHWEST.

A vote of thanks was also extended to James R. Dee for his management of the entertainment at Hancock and Calumet. A vote of thanks was extended to the mayor of Duluth and the citizens of Duluth and Superior, and to the mayor of Superior; also to the people of Sault Ste. Marie and to the Calumet and Hecla Copper company.

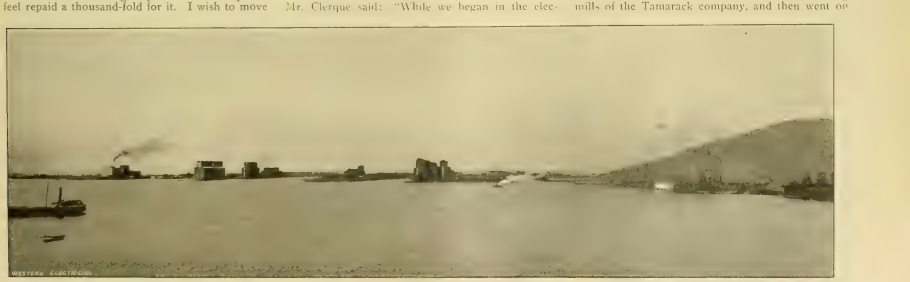
Mr. H. M. Atkinson: There is one pleasant duty that, if I am right, I think has been neglected thus far, and in getting up to make this motion. I wish to say that I heartily reiterate the words that have already been said here to-day of the pleasures of this trip. The trip from Chicago to this city will be one of the pleasantest recollections of my life, and I feel very grateful, as we all do, to the officers of this association, and I wish to say that I think the trip could have hardly been more perfect in every detail. The arrangements and accommodations on the steamer and the incidents from first to last have been most interesting and pleasant. I came a long way to take the trip and I feel repaid a thousand-fold for it. I wish to move

visitors disembarked and marched in a body through the streets of Sault Ste. Marie, passing under a magnificently illuminated arch to the Iroquois Hotel. Here the convention and its guests were welcomed by Mayor P. C. Kelliher. The address of the evening was delivered by F. H. Clerque, the most prominent and enterprising man of the Northwest, and the one to whom the association is indebted for its royal reception and entertainment at the Soo. Mr. Clerque described the resources and natural advantages of the country and some of the industries which are now developing. He said: "I have just received cable advices from Krupp's works, announcing their tests of the product of electrical furnaces in the line of ferro-nickel and nickel-steel have been satisfactory, and a contract, which I had already negotiated with them, dependent upon the samples proving satisfactory, was by cable confirmed. We are now about to put 20,000 horse power on the American side to this new use, the production of ferro-nickel and nickel-steel." In conclusion Mr. Clerque said: "While we began in the electrical industry here in the development of new electrical processes, only two or three years ago, we are already under contract to deliver 40,000 horse power for electrical uses, all to be supplied within two years. We have already developed on the Canadian side 20,000 horse power, and are about to undertake the construction of another canal on the Canadian side to produce 50,000 horse power. So, gentlemen, although we are a small community, and, as you may think, simply on the frontier, it is a fact that we have now developed and in use here more actual horse power than is under the control of any hydraulic power canal in the world. When the present contracts for power are completed the horse power furnished will exceed all the hydraulic horse power furnished in the world at the present time."

Professor Fujioka of Japan made a neat address,

solo by H. P. Goodwin, a song by Mrs. W. M. Lowry, a recitation by Thomas R. Mercein, a piano solo by Mrs. Joseph Wetzler, a comic recitation by H. G. Underwood, imitations by Frank L. Taylor, quartette by Mrs. Lowry and Messrs. Page, Knutsen and Abadie. During the intermission of the concert Mrs. Underwood christened the Libbey Glass Works prize bowl, which she had won, with some delicious claret punch, and a most enjoyable evening was ended by a number gathering around the piano, singing college songs.

Word had been passed before retiring Sunday night that all hands would be called at 6 a. m. Monday morning, in time to secure a good breakfast and board the train for the trip to the mining installations, to start at 7:30. The first stop was at the Dollar Bay Wire Works. After the party had inspected the process of the manufacture of copper wire, the trip was continued to the smelting furnaces of the Calumet and Hecla mines, and thence to the crushing mills. The train was backed to the crushing mills of the Tamarack company, and then went on



NORTHWESTERN ELECTRICAL ASSOCIATION.—VIEW BETWEEN DULUTH AND SUPERIOR FROM STEAMER NORTHWEST.

a vote of thanks to Mr. Hill and the members of his committe who have been so untiring in their efforts to add to our pleasure on this trip.

The resolution was unanimously carried, and the convention adjourned sine die.

Features of the Entertainment.

The evening of the first day out was spent in the unique manner of having the first meeting of the association in the saloon of the Northwest. It must be confessed, though, that it is a difficult matter to mix science and pleasure, and, for once, it may be said that science suffered in the contest.

During the first night out, owing to a heavy fog, considerable time was lost, and for this reason the schedule that had been planned was abandoned. The Northwest did not reach Mackinac until late in the afternoon. There was much discussion as to

to Osceola, where a brief stop was made. The special was then pushed on the Red Jacket and Calumet for the inspection of the immense mining installations of that renowned company. At Calumet the party was met by a large number of vehicles sent by the Calumet and Hecla company, and under the escort of Captain Duncan, superintendent in charge, and E. N. Bosson, the party was escorted over the properties of the Calumet and Hecla company. It would be impossible to mention in detail all the interesting sights presented in the inspection of these plants. It may be said, however, that the party visited the air compressors, shafts and the power houses, and saw what is probably the finest mining machinery plant in the world. Incidentally, it may be said that one of the shafts of

Developing Power of Lower Niagara.

By Orrin E. Dunlap.

The problem of developing the power of the Falls of Niagara having been satisfactorily solved without detriment to the scenic features of the great cataract, attention is now directed to the development of the rapids of the lower Niagara. This desire to develop power on the lower river is brought about by the situation on the Canadian side of the stream. Some years ago the commissioners of Queen Victoria Niagara Falls Free Park entered into an agreement with a body of men, organized under the title of the Canadian Niagara Power company, whereby they, the commissioners, receive the sum of $25,000 per year for the exclusive privilege of developing power in the Queen Victoria Free Park. This amount of rental stands for a period of 10 years, after which time it increases $1,000 per year, until, in the 20th year, the annual rental reaches the sum of $35,000, at which price the privileges, under the agreement, may be retained by the Canadian Niagara Power company for a century from the date of the agreement. Under the franchise so obtained the Canadian Niagara Power company was to have 10,000 horse power developed by November 1, 1898, and have water connections made for 25,000 horse power, but within the year an arrangement has been made between the power company and the commissioners whereby the Canadian Niagara Power company is not forced to this feature of the agreement, but has been allowed to contract with the Niagara Falls Park and River Railway company, which company owns a wheel-pit and tunnel in the park for the development of power for the operation of its line, on the installation of certain apparatus in the railway company's station to develop power to be supplied to patrons of the Canadian Niagara Power company. It may be incidentally remarked that this arrangement is quite likely to develop all the power demanded locally on the Canadian side for some time to come, while it will also give the Canadians an opportunity to profit in the final installation of the Canadian Niagara Power company by obtaining all the latest apparatus for the development and transmission of power, built in accordance with the latest designs. While to some the extension of time thus practically granted to the Canadian Niagara Power company might appear to a way to retard the progress of the Canadian side of the river, so far as the development of Niagara power is concerned, such can hardly be accepted to be the case for various reasons. The condition of things existing on the Canadian side at Niagara Falls at present from that on the New York side is such that it was early apparent to the members of the power company, as well as to the park commissioners and government leaders, that the market for minimum blocks of power, likely to be developed by the Canadian Niagara Power company, must be found at some distance from the station or point of development. The mentioned probable markets are the city of Toronto and the city of Hamilton, the first of which is about 90 miles distant from the Falls. Toronto is very anxious to feel the impulse and thrill of the Niagara electric current, and will welcome its coming. The distance, however, from the Falls to Toronto is such that with known methods of transmission the loss is likely to be too great for profit. A week, a month or a year may change all this, and the loss may be reduced to a minimum amount. The Canadian Niagara Power company is practically the same as the Niagara Falls Power company, owner of the very successful development on the New York state side, and for this reason it has every chance of profiting by the researches of this company in the electrical field.

On the Canadian side eagerness for the development of power from some source is apparent, and, as the agreement with the Canadian Niagara Power company removes the falls from consideration, other parts of the river have therefore been given attention. The commissioners instructed Superintendent Wilson to ascertain the prospects, and he has reported that there are four or five principal points at which it would be entirely feasible to take advantage of the shore levels to develop substantial water-power plants, and, by the aid of electricity or other means of transmission, make the power available on the cliffs for commercial purposes. The conditions under which these several powers can be best developed are not at all uniform. By consulting the map it will be seen that the points of development are Nos. 1, 2, 3, 4 and 5. In plant No. 1, from the head of the rapids at A to the head of the Whirlpool Rapids eddy at B, in a distance of some 3,400 feet, there is a continuous rapid with a fall at mean water level of about 44 feet. In the development of power at this point a tunnel or conduit of large dimensions could be constructed as a head race, and the power station and machinery located at B. With a head race of 20 feet internal diameter, and with a loss of head of 14 feet in the entire length of 3,400 feet, from 22,000 to 44,000 horse power could be obtained under an available head on the water wheels of 30 feet. The estimated cost of the conduit and terminals would be about $450,000. From this point power could be furnished on the high bank for about $60 or $65 per horse power, and after allowing for all loss in machines, the amount of power available would be about 15,000 or 16,000 horse power. A larger head race would give more power at a less outlay per unit. Thus, a conduit of 24 feet internal diameter laid to the same grade would afford fully 40 per cent. more power, while the cost of the terminals, buildings, inclines, etc., would be nearly the same in either case.

Plan No. 2 would develop a comparatively small amount of power, but it would be conveniently located for consumption. It could be most readily developed by an open cutting in the rocky point separating the Whirlpool Rapids eddy from the whirlpool proper, or by a flume sunk in the talus at the water's edge. A raceway 30 feet wide and 10 feet deep would give a net capacity of 2,000 electrical horse power. As the head is small, the cost of horse power would be increased as compared with No. 1.

Plan No. 3 contemplates a development of power at the outlet from the whirlpool, and this could be done at small cost, as a moderate capital outlay per horse power would suffice to construct and equip a power of 1,500 to 2,000 horse power capacity.

While plan No. 4 is well adapted for generating water power on a large scale, it would be much more costly per unit of power developed than any of the others. The same method of development as that proposed for No. 1 might be adopted, but the greatest head obtainable would be about 13 feet, and the same description of flume would yield less than one-third the power, while the cost of terminals, buildings, etc., would be the same, and the cost of water-wheels more. There is, however, an abundance of room at this point for buildings and a fine lot of building material. The cost of construction would amount to three times as much, while not over 5,000 horse power could be obtained.

By plan No. 5 about 5,000 horse power could be developed at a probable cost of $75 per effective horse power. At this point the plant could be duplicated at any time.

In projects Nos. 1, 2 and 3 the talus would have to be cleared off and excavations made for the power houses, and in each instance access secured from the top of the bank by means of inclined planes or vertical lifts. The problems of how best to deal with floating ice and frazil would require careful consideration.

Surveys made from time to time by the United States geological and lake surveyors disclose the fact that there is a total mean difference of level between the waters of the Niagara River at the base of the Horseshoe Fall and the waters of Lake Ontario of 110 feet. Of this total about two feet is found in the navigable reach of water from Lake Ontario to Lewiston, and about 16 feet from the base of the Horseshoe Fall to the beginning of the rapids, leaving some 92 feet in the rapids above and below the Whirlpool. Those who have visited Niagara know that the inclination of the surface of the river, in the portions covered by rapids, does not present a uniform cross-section, owing to the contracted width of the stream at some points and the very broken nature of the waterway. For instance, the part of the river locally known as the Whirlpool Rapids has a grand and resistless sweep all the way from the lower steel arch bridge down to the most northerly extremity of the Whirlpool, but obstructions on either shore, in the form of great boulders, interfere with the onward flow of the water, while numerous eddies or countercurrents are formed, and the inclination of the surface of the water at the shore line is made very irregular, and at some points is much below the central elevation of the stream. Just south of the Whirlpool the shore line on the Canadian side recedes considerably, forming a long,

DEVELOPING POWER OF LOWER NIAGARA.—PLAN SHOWING COURSE OF RIVER AVAILABLE FOR WATER-POWER BELOW THE FALLS.

shallow bay, called on the map, herewith given, the "Whirlpool Rapids Eddy," in which there is a strong current flowing up-stream along the shore for the whole length of the bay. The same condition holds with reference to the Whirlpool itself, where the sweep of the current, after crossing to the north shore or the head of the pool, is deflected to the left and southwards, and flows swiftly along the Canadian shore to the southerly extremity of the Whirlpool, a distance of over half a mile. The same unusual conditions prevail at either end of Niagara Glen, and where the changes are well defined and are a permanent characteristic of the stream the difference of level between the adjacent counter-currents indicates, in each case, the head which may be obtained; and the direction of the shore eddies, above and below the rapids, defines clearly on the ground the distance which will have to be overcome by means of a conduit or other method in order to obtain the greatest advantage from the head of water at the point in question.

Explanation Wanted.

EXPLANATION WANTED.

the following comment: "Can you give an explanation of why the spark seems to have no jagged points as the sparks appears to the human eye? I have noticed especially that photographs of lightning are without the sharp points. As it is said that the camera 'sees' better than the human eye, is it probable that the actual course is not as we see it but as the camera shows it?"

Transformer Regulation.

By A. R. Everest.

The regulation drop in a transformer is a drop in voltage at the secondary terminals of the transformer when delivering current, due to internal losses in the transformer itself, the primary voltage remaining constant.

Apparently the easiest way to determine the regulation of a transformer would be by direct measurement of the voltage at the secondary terminals; first, when the transformer is carrying no load, and secondly, when the transformer is carrying full load, the difference between the two being the regulation drop, provided the primary voltage is kept constant.

In practice, however, this test is attended with a number of difficulties, so great, in fact, as to render the test perhaps the most difficult and unsatisfactory of all transformer tests. Even when the voltage on the primary side is observed by an independent voltmeter (and step-down transformer) it may frequently happen that the temperature coefficients of the two voltmeters are not alike, producing discrepancies in the readings which, in themselves

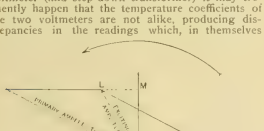

Fig. 1

TRANSFORMER REGULATION.

small, produce a large percentage error in the quantity to be finally determined.

Absolutely steady readings are also desirable for the success of this test, and this is a condition which is very seldom attained. The pulsations of a slow-speed engine reflected on the voltmeter needle are often sufficient to make the test absolutely worthless.

There are several other minor factors which tend to disturb this test. Most of them can be met independently, as by exchanging voltmeters between readings, by taking large numbers of readings at each point and averaging results, and so on; but experience continually shows that with the greatest care the results obtained by this method cannot always be relied upon.

Perhaps the hardest point of all in connection with the regulation test as commonly made is the difficulty of persuading the station electrician who makes his own tests that his results (often absurd) are open to question.

But since the losses creating the regulation drop in a transformer can be independently measured, the calculation of the regulation from these observed losses becomes a simple matter.

The regulation drop in a transformer is caused by two losses. First, the energy loss or C R drop in the transformer windings; secondly, the reactive drop or inductance of the transformer. In certain special cases we must also take into consideration the effect of the magnetizing current in the primary, since when the latter is relatively large it produces a phase displacement between the primary and secondary currents and has the same effect on regulation as an increase in the reactive drop.

When this phase displacement is so small as to be insignificant, the calculation of the drop of the transformer is reduced to the resolution of a right-angle triangle.

We desire for the base line the total energy drop, including that in the transformer and in the external circuit.

Perpendicular to this is laid off a line representing the reactive drop in the transformer—we are here assuming that the external load is non-inductive.

The hypotenuse joining these two sides of the triangle now represents the primary applied voltage. We may call this 100 per cent.

If the reactive drop is, say, three per cent., the horizontal becomes the square root of 100^2 minus 3^2, or, roughly, 99.2 per cent.

If the known C R drop in the transformer amounts to two per cent, we have left, for per cent. voltage (= 99.2 per cent. — 2.2 per cent.) at the secondary terminals, as compared with the primary input, or, in other words, there is three per cent. regulation drop in the transformer.

In many cases, however, especially when testing an unknown transformer, it is necessary to take into account the effect of magnetizing current. The calculation is then not quite so simple, but by means of the method shown below the determination can be made with the greatest accuracy. This method has the advantage of appealing directly to the eye by means of the well-known transformer diagram.

Fig. 1 shows the relative directions of secondary current, primary current and resultant magnetizing force and flux.

O L is the primary exciting current at no load. It consists of two components, O M, the true magnetizing component in phase with the flux O M, and M L, at right angles to this, which is the energy component representing the energy expended in core loss.

When the secondary circuit is closed the primary current will adjust itself in magnitude and direction so as to maintain the vector O L as resultant of primary and secondary magnetizing forces.

The magnetic flux O M generates in the transformer windings a voltage O E, 90° behind the flux in phase. This is the active voltage of the secondary circuit, and also appears as a counter electromotive force in the primary circuit, where it is shown as O I (Fig. 2).

It is here assumed that the secondary circuit is non-inductive, hence the secondary current is in phase with the induced electromotive force O E. (For simplicity we also assume that the transformer has a ratio of 1.) The voltage impressed on the primary to maintain the secondary current must be the resultant of three components (Fig. 2), I O opposing counter electromotive force 90° ahead of flux O M, I D overcoming primary C R drop in phase with primary current, R D opposing reactive drop and 90° ahead of primary current. The resultant of these is O R, which is primary impressed voltage.

It will be noted that this primary voltage O R is really the resultant of two values, R I, the primary impedance drop, and I O, the secondary induced electromotive force. If we can calculate these, and know the secondary C R we have the regulation at once.

It will be observed that any increase in magnetizing component increases the lag between primary current O P and counter electromotive force O I. Since the base line I O of primary-impedance triangle (the C R drop) must be always parallel to O P (the primary current), it follows that an increase in magnetizing component will swing the primary impedance vector I R more into phase with the secondary vector. volts I O, increasing the value of the primary impressed voltage O R for any given secondary voltage.

If the diagram is plotted on squared paper with sufficient accuracy, the regulation can be obtained at once from Fig. 2, since when O R is primary impressed voltage O I is to same scale secondary induced voltage and may be expressed in per cent. of the former. Deducting the secondary C R drop in per cent. we have the percentage of primary voltage appearing at secondary terminals. But for greater accuracy it is preferable to calculate the side of the diagram.

In Fig 3 let the vectors I D and D R be replaced by I J and J R, the vector of primary impedance I R remaining unchanged.

From the known values of primary impedance, C R and reactance, the angle (a) of the impedance triangle is known. The corresponding angle J I E = (b) of the new triangle is equal to (a) reduced by the small angle J I D. But this latter angle is the angle of lag between primary current and counter electromotive force and is readily found from the known values of exciting and full-load current. (A tabulation of the lag angle for values of exciting current from five per cent. to 20 per cent. is given further on.)

Having found the new angle (b) and knowing the value of primary impedance, the new vector J R (which we may call equivalent reactive drop) is found as the sine of the angle (b) and the vector I J (or equivalent primary C R) is cos. of same angle.

Having expressed all the values in per cent. of primary voltage for convenience, we now resolve the right-angle triangle O R J, taking O R = 100 per cent., R J = equivalent reactive drop per cent., and obtain O J, which is secondary terminal volts per cent.—secondary C R per cent.—primary equivalent C. R. per cent. Knowing the last two values, we at once have the per cent. of primary voltage appearing at secondary terminals, and therefore the regulation of the transformer.

As an illustration, the method will be applied to the determination of the regulation at full load of a transformer on which the following measurements are known. The measurements of copper loss and impedance drop are made by means of a wattmeter, the secondary of the transformer being short-circuited.

Capacity of transformer, 2,500 watts.
Ratio of transformation, 10:1.
Primary voltage, 1,000; frequency, 125 cycles.
Copper loss (C R), 50 watts.
C. R. drop two per cent.
Impedance drop, 54 volts = 5.4 per cent.
Iron loss, 60 watts.
Exciting current (no load current in primary at 1,000 volts), .125 ampere.

The lag angle of primary current behind counter electromotive force line is determined from the relative values of primary exciting current and primary full-load current. For convenience, the lag angles are tabulated below for values of exciting current from five per cent. to 20 per cent., on the assumption that the magnetizing component is 80 per cent. of the exciting current. This is sufficiently accurate for all ordinary transformers on frequencies of 50 cycles and above. The value increases, tending towards 100

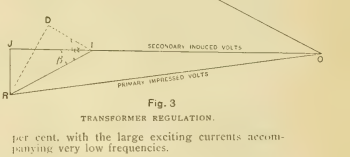

Fig. 2

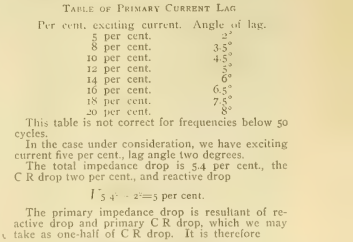

Fig. 3

TRANSFORMER REGULATION.

per cent. with the large exciting currents accompanying very low frequencies.

TABLE OF PRIMARY CURRENT LAG

Per cent. exciting current.	Angle of lag.
5 per cent.	2°
8 per cent.	3.5°
10 per cent.	4.5°
12 per cent.	5°
14 per cent.	6°
16 per cent.	6.5°
18 per cent.	7.5°
20 per cent.	8°

This table is not correct for frequencies below 50 cycles.

In the case under consideration, we have exciting current five per cent., lag angle two degrees.

The total impedance drop is 5.4 per cent., the C R drop two per cent., and reactive drop

$\sqrt{5.4^2 - 2^2} = 5$ per cent.

The primary impedance drop is resultant of reactive drop and primary C R drop, which we may take as one-half of C R drop. It is therefore

$\sqrt{5^2 + 1^2} = 5.1$ per cent.

In Fig. 2 we then have I R = 5.1 per cent.
I D = 1 per cent.
D R = 5 per cent.

To find the angle R I D we find what angle has its sine

$(R\,D) = \frac{5}{5.1} = .98$;

The angle is 79°. (See angle (a) Fig. 3.) Deducting from this the current lag angle, we have for the angle (b) 77°.

J R is the sine of this new angle and .974 × 5.1

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50, with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies, 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—The WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own.* THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

Mr. Dow's paper before the National Electric Light association on "Public Lighting in Relation to Public Ownership and Operation" was pronounced one of the ablest contributions upon this subject that has yet been presented by those who attended the discussion of this topic last week. The paper and the remark of Messrs. Atkinson and Scovil are presented in the issue.

All who attended the meeting of the Northwestern Electrical association are greatly pleased with the trip up the lake and the convention itself. It was a novel experience and it gave the members an opportunity to see a part of the country, and become acquainted with the industries of a section, in which electrical engineers are deeply interested. The great copper mining country and the water power at the Soo cannot fail to make an impression upon the history of the electrical interests of the country. Already the wonderful resources of that section are being utilized, and electricity is employed to develop and place them at the command of the world, and this is only the beginning. The excursion-convention may do much toward turning the thoughts of many toward the great advantages of the copper country.

Not content with the prominence attained through the "telectroscope," Herr Szczepanik is said to have perfected an invention that is destined to revolutionize an important branch of the textile industry. By utilizing photography and electricity he claims to be able to accomplish, in a quarter of an hour, the work of designers which heretofore has occupied months or years, according to the size of the design. By means of a photograph about four feet square the design for a Jacquard loom is reproduced with all its squares; the stencils are rendered unnecessary, and the tedious work of a year or two is accomplished in a quarter of an hour; farther, by the use of electricity the inventor sets in motion not only the punching levers, but also the threads in the loom itself, and weaves direct from the original design plate. The question has been asked: "What need of this punching machine at all if you can weave direct from the original design plate?" "It is clear," answered Herr Szczepanik, "that it would be most difficult all at once to abolish all the looms now in use, thus annihilating the great capital invested in them. Accordingly economic considerations induced me to devise a middle course, that of the stencil-punching machine, in order immediately to enable the manufacturer to produce more cheaply and to afford him an opportunity of introducing the electric looms gradually." It is said that the first public appearance of this new wonder is reserved for the Paris exhibition, where it will weave silk handkerchiefs. According to the London daily papers, which have shown great interest in the scheme, the purchaser of such a handkerchief will be photographed by an apparatus in the loom itself, the design plate will be prepared by the same machine, and then it will make a silk handkerchief with the purchaser's likeness woven into it, so that in not more than half an hour from the time when the portrait was taken the buyer will be able to take away with him as a memento of the exhibition a handkerchief with his inwoven portrait. This announcement sounds like a "quack medicine man's" advertisement, but it may be work of the London reporters instead of Herr Szczepanik.

During the present session of Congress there has been unusual interest manifested in legislation affecting the Patent Office. Numerous bills have been introduced providing for modifications in existing regulations, and many valuable measures have been proposed for the improvement of the service. When Commissioner Duell assumed charge of the office in February he found nearly 10,000 new and nearly 4,000 amended applications awaiting consideration. The new work was in date back to July, 1897, and the amended work back to September, 1897. He early directed that the old work should be brought up and kept up to within 15 days, and whenever necessary the force should remain after closing hours to accomplish this result. By this means the office has made a gain of 1,200 cases in the amended work, but the commissioner knew that this could not be kept up continually, and, accordingly, he set about to secure additional help. The Hicks bill which was passed last Monday makes ample provision for improved service, as it gives 28 additional examiners to the force of the Patent Office, distributed as follows: Four principal examiners, four first assistant examiners, four second examiners, eight third assistant and eight fourth assistant examiners. With this additional force the commissioner expects to bring up the arrears in work in the office before January 1st next, as well as to transact all new business promptly and thoroughly as applications are filed. He will also proceed to effect the classification of the United States and foreign patents, publications, etc., so that more perfect and more expeditious searches may be made. Some idea of the pressing necessity of an increase in the force of the office can be gained by considering the amount of business transacted and the clerical force and examiners at the command of the commissioner. In 1886 there were 188 examiners; there are now 200. The number of applications received in 1886 was 39,968; the number in 1897 was 47,905, or an increase in the work of about 33 per cent., to meet which the force was increased about six per cent. The commissioner was able to demonstrate to Congress that the examiners in 1897 did at least 17 per cent. more work than in 1886. The fact that the Patent Office is one of the few bureaus that may be said to be self-sustaining, was another favorable feature which helped the bill.

Opposition to the construction of trolley lines is not limited to abutting property-owners, as there is occasionally a case where some other company's line must be crossed, and then the old phrase, "When Greek meets Greek," may well be modified and modernized into something like, "When trolley line meets trolley line." The result may be imagined. In Chicago the wrecking wagon of one company was utilized in destroying the property of another, and frequently there have been vigorous controversies between the employes of rival companies, but generally these incidents have closed the controversy. Down in New Jersey, however, the courts have been appealed to, and the question raised as to whether a company's rights in its tracks and trolley system, operated in the public streets, are property rights, which cannot be interfered with against its consent, without compensation. This proposition was advanced in the case of the Consolidated Traction company against the South Orange and Maplewood Traction company, which was before the Court of Chancery of New Jersey last March. It was made clear that the construction of the crossing objected to would not only interfere with the operation of the complainant's road during the period of construction, but would also permanently change the actual condition of the complainant's property, especially by the substitution of a "frog" for a continuous unbroken rail. Furthermore, a permanent change would be effected in the method of operating its trolley wires at the point of crossing.

In the decision the court held that so far as related to the mere interruption of the operation of the first road during the period of construction, there could be no basis for compensation, for the original company's right to the use of the street was subject to the right of the public to cross its tracks located therein, and to the right of the public authorities to provide for crossing the tracks by any carriages or vehicles which have the right to use the street for travel, and to interrupt the company's operation in such reasonable manner as may be necessary to provide for the construction of the crossing, when the right to cross exists.

Concerning the second point, the decision is equally explicit. The court determines that although the crossing, as proposed, necessitated some actual interference with the tracks and wires as originally constructed, and terminated their exclusive use by the complainant at the crossing, it would not prevent the crossing by a similar railway company, without compensation, if made under the proper legislative authority. In support of this opinion it is pointed out that these changes are the necessary result of the development of the method of operating electric roads at their points of crossing, and they are therefore changes and burdens in the use of the tracks and trolley system to which the original right to lay and construct them was necessarily subject, and, in a legal point of view, continues the court, are different only in degree, and not in character, from the changes in the property and control of the tracks made in the ordinary horse-car crossing.

However, the court suggest that the company desiring to make the crossing would have no right arbitrarily to select its own time or manner of erecting the crossing, but would be bound, if no agreement were made, to give due notice both of the time and manner in which the crossing was proposed to be made. And it holds that a court of equity has jurisdiction to control the construction of a crossing, if the parties cannot agree, and that where the right to construct a crossing exists, a court of equity will, if necessary, and on application of either party, interfere to control the construction.

WAR NEWS.

Cable-cutting Expeditions.—During the last week the scene of activity on the Cuban coast changed to Guantanamo, which, like most other Cuban harbors, is long and tortuous. The town of Guantanamo is 15 miles inland, and only the little fishing village, the blockhouse and the cable station were at the entrance. The place was bombarded on June 7th, and it was found on landing that a solid shot from either the Marblehead or the Yankee had cut the wires on the side of the cable station, while another had smashed the batteries and instruments inside. This proved the most effective of any of the cable-cutting expeditions of the Americans.

It is rather singular though that it was not the intention of Admiral Sampson to destroy this cable landing, but to gain possession of it for his own use. According to a well-informed correspondent, "It is the general opinion that the landing of the marines at this place was for the purpose of establishing a suitable naval base, and it is believed that the Cape Haytien cable which leaves Cuba at this point, and which has been cut for several days, is to be repaired by Admiral Sampson at Caimanera and maintained open in order to enable ready communication to be had with Washington. The landing of the marines was undoubtedly with the object of holding this cable station. It is pointed out that direct communication with the departments at Washington will be of the greatest benefit in the cooperations of the naval and military forces, for otherwise it would be necessary to send all the way to Port Antonio or Kingston, Jamaica, or to Port au Prince or Mole St. Nicholas, Hayti, a distance of 150 to 175 miles, when it is desired to send or receive dispatches."

Further details of the work at Santiago have been furnished by Captain Phillip of the Texas, who proudly displays as a trophy "five feet of the cable which was wrenched from its resting place 400 fathoms below the surface of the Caribbean Sea." For five days the little cable steamer Adria had dragged the waters for two miles east and west of the entrance to Santiago harbor without success. On the second day the Adria clutched the cable, but in raising it one of her steam winches broke and she lost it. The work was kept up all day and as far into the night as possible. The Texas was assigned to protect the Adria from possible attacks from the shore.

On Sunday afternoon about four o'clock the Texas, which had been sent to the other end of the line, while the Adria was dragging directly opposite the harbor entrance, was returning slowly, when her lookout discovered one of the Spanish torpedo-boat destroyers creeping out from under the shadow of Morro Castle. She was headed directly for the cable ship. The Texas crowded on all steam, being then about a mile away from the Adria, and cut in between the cable ship and the torpedo-boat destroyer, which saw the battleship bearing down with her guns trained upon her, turned about and fled behind the shelter of the forts. After this the Texas stuck close to the little Adria. At six o'clock that evening the winches of the Adria began to sing, and a stentorian voice hailed the Texas, saying: "We have the cable." It took the Adria three hours to raise the cable from its deep bed. At just nine o'clock the cable was on board and cut, and the news was signaled to the fleet. The Adria cut the cable about two miles due south of Morro Castle

It is probably known to comparatively few newspaper readers that the weather reports received from the Cuban capital are an important factor in the records of the weather bureau organized by the United States government. Weather reports were received from Cuba under the international arrangement, and the plan was regarded by General Greely of the Washington signal service with great favor, as the atmospheric conditions in Cuba play an important part in the work of forecasting tidal storms. During the last decade the reports have been received every day, and the first omission in the records is now caused by the severance of the cable. The West Indian seas are looked upon as the home of the tidal storms which yearly visit the South Atlantic coast, and the visitations may not easily be forecasted for this country if the war continue and the cable service remains interrupted. A resumption of the practice of sending weather reports to this country from Cuba is not expected until Havana shall have capitulated to the American forces. If the reports had continued coming, the Washington weather bureau and the branch offices would have issued with their other forecasts daily bulletins of the weather that the American troops were having in Cuba. But when Admiral Sampson cut the last cable out of Cuba he severed a long established connection between the Cuban weather bureau in Morro Castle, Havana, and the American weather service. The naval commander's act proved more potent than war itself, for since the commencement of hostilities with Spain the weather reports from Cuba had arrived regularly from Havana every day. The temperature in Havana since the cable was cut, the degree of humidity and the precipitation, if there were any, are lost to the records of the Chicago weather office. What the declaration of war and actual hostilities were unable to interrupt the cable cutters stopped entirely. And, despite the patriotism of the forecaster, the act of naval strategy has caused him grief, for the accuracy of his data has been marred.

As usual, on the heels of the reported cutting of the last Cuban cable comes the statement from Madrid that "the minister for foreign affairs, Duke Almodovar de Rio, says there is no truth in the statement that the cable communicating with Santiago de Cuba has been cut, adding that he received dispatches from there this morning."

A press dispatch from Port au Prince, June 14th, says that "the Haytien steamer Mancel, chartered by the cable company and carrying cable and cable-repairing apparatus, left last night for Cape Haytien to re-establish cable communication between Mole St. Nicholas and Santiago de Cuba."

One of the stay-at-home patriots of the Chicago press indulges in the following comment upon efforts that have been made to interrupt cable comunication between Cuba and Madrid: "Like a good many other undertakings of the strategy board, the operation of cutting Blanco's cable communications appears to proceed somewhat slowly. We have had half a dozen cable-cutting expeditions—one of them attended with loss of life—yet Blanco continues to telegraph Madrid with as much ease and facility as though he carried a Western Union frank. As a matter of fact, the whole cable-cutting business has been bungled. The strategists deemed it necessary to go close inshore after the cables, when a regularly equipped cable steamer could have picked them up 100 miles at sea and, by cutting out a mile or two of the wire, communication would have been effectually shut off until the return of peace. It is merely owing to the obtuseness of the war board that Blanco is enabled to continue cabling accounts of glorious victories every time an excited Spanish artilleryman begins blazing away at the moon with the idea that it is a searchlight on an American man-of-war."

Recruiting Signal Company.—Captain John B. Inman, commanding the signal troops of Illinois, completed preliminary arrangements at Chicago June 13th for recruiting a signal company. Captain Inman says he expects to have the company recruited at the Springfield armory and ready to report to Washington for assignment next week. He has over 100 applications from good telegraphers who are desirous of entering the service.

Miscellaneous Notes.—Several years ago Lieutenant Fiske pointed out that the engineering branch of military service offered inducements to educated men who desired to be identified with the service. His remarks are now recalled by the announcement that the brigade of engineers, United States Volunteers, will include scientists, electrical, civil, mechanical and topographical engineers, college professors and men prominent in the commercial world. It is generally believed that Colonel Gillespie of the Corps of Engineers, U. S. A., will command the brigade, and that Captain Eugene Griffin of the General Electric company will be colonel of the first regiment, which will include William B. Parsons, chief engineer of the Rapid Transit Commission of New York; Dr. Louis Duncan, professor of electrical engineering in Johns Hopkins University; Eugene Ellicott, secretary of the University of Pennsylvania and topographical and hydrographical engineer of the United States Coast Survey and Captain G. W. Bramwell, W. G. Ramsay, F. M. Barstow, I. A. Steinmetz, Walter Abbott, general manager American Projectile company, and Lieutenants Rodman and Walke, explosive experts.

It will be of interest to the general public, hardly less than to the electrical fraternity, to know that Lieutenant Frank J. Sprague, who has for the last six weeks been confined to his house, and in great suffering, from a severe injury to his right eye, is in a fair way to recovery. Nearly two months ago a piece of the eyeglass Mr. Sprague was wearing was accidentally forced into the ball of the eye, and the sufferer had to remain for two weeks under the care of a specialist. Being very anxious to push forward to definite shape the volunteer corps of electrical engineers, which he offered some time ago to organize for early service at the front, Mr. Sprague imprudently went to Washington, where he caught cold in the injured eye. Severe complications set in, along with iritis, and for some time it was feared that blindness was inevitable. This danger, however, seems to have passed, and there is every prospect that Mr. Sprague will soon be able to renew his active part, both in the affairs of the company with which he is identified and the formation of a fighting corpse that shall fill a place of its own in the war resources of the government.

Captain Hurd, mechanical engineer for the Crane company of Chicago, has offered his services to the government and is now engaged in the preliminary work of forming a company of engineers.

The accidental explosion of an electric torpedo boat at St. Augustine, Fla., on June 10th resulted in the death of J. J. O'Rourke, an electrician, and his assistant named Houston. First Lieutenant William W. Hart, engineer officer in charge of the work of placing mines at the mouth of St. John's River, was struck in the back and head with pieces of torpedo and was injured severely. Mr. Burnham, a stenographer, and a colored man were wounded. Lieutenant Hart graduated from West Point in 1889 and is an expert in mining work. O'Rourke was foreman of the Western Union telegraph office in Jacksonville for several years.

The electrical fraternity will be interested in the controversy between Hiram S. Maxim and Hudson Maxim. The latter claims to have invented a system of throwing high explosives from ordnance at such a range that, if successful, no fleet could live against them. He has offered his invention to the American government. Some of the English newspapers have alluded to the inventor as "Mr. Maxim" only, which has brought a disclaimer from Hiram S. Maxim and a statement of opinion that the reports are "foolish, absurd and ridiculous." This has called forth a retort from Hudson Maxim, who wants to know what about that aerial machine which "Hiram" invented, and which "flew about as far as a locomotive would under the same circumstances."

Electricity seems to have played a part in the sinking of the collier Merrimac, according to the account furnished by Captain Miller, who witnessed the daring deed and was familiar with the preparations that were made for it. He said: "The Merrimac had been thoroughly stripped of valuable articles, even the clock and bell being taken off. Along one side a torpedo belt had been arranged about 10 feet below the water line, six torpedoes being placed so as to break open the compartments. These torpedoes had electrical connection with a battery on the bridge and were to be discharged by pressing a button. The man at the key was undoubtedly Lieutenant Hobson. The plan was carried out perfectly."

Transformer Regulation.

[*Continued from page 361.*]

= 4.96 per cent. Similarly, J I is the cosine of 77° and is in value $.225 \times 5.1 = 1.15$ per cent.

To determine the regulation we now resolve the right triangle R O J.

R O = 100 per cent.

R J = 4.96 per cent.

$$J\,O = \sqrt{100^2 - 4.96^2} = 99.87 \text{ per cent.}$$

Deducting J I — 1.15 per cent., we have 98.72 per cent. as secondary induced voltage (IO), and deducting again secondary C R drop one per cent., we have 97.72 per cent. of primary applied voltage appearing at the secondary terminals, or a regulation drop of 2.28 per cent.

It is of interest to note here that figuring the regulation of this transformer by the simpler method first described, entirely ignoring the effect of exciting current, the result gives 2.13 per cent. regulation drop, a difference of 0.15 per cent., due to five per cent. exciting current. With a larger reactive drop in the transformer, other losses being equal, the difference between results obtained by the two methods would be somewhat greater.

Calculated by Dr. Bedell's method, the regulation drop obtained is 2.44 per cent.—slightly higher than that by the method above. This is due to the fact that Dr. Bedell's method assumes that the magnetizing current is equal to the exciting current, which is not the case, and also in a slight degree to some other minor apptoximations adopted in the construction of his diagram.

The percentage of iron loss and exciting current taken in the above illustration are higher than would be found in good modern transformers of any but the smallest sizes, but they have been purposely taken here to illustrate the point under discussion. For the same reason the diagrams are greatly exaggerated. In actual practice the primary current line O P is very nearly parallel with the line O I.

Important Patent Legislation.

[From the Washington correspondent of the Western Electrician.]

A 10-years' fight for modern business methods in handling inventions in the Patent Office was culminated in the House of Representatives on June 6th, when Representative Hicks, chairman of the committee on patents, secured the passage of his bill for revising and perfecting the classification of letters patent and printed publications in the Patent Office. For the last 10 years the work of the Patent Office has been steadily falling in arrears, and business men and inventors throughout the country have deluged the office with complaints, but the officials were powerless to do anything, owing to the meager appropriations allowed by Congress. The bill, as passed, carries an annual appropriation of over $60,000, and provides for the employment of o additional examiners and assistant examiners. The measure has already passed the Senate, and only awaits the approval of the president to become a law.

There is a provision in the bill which will be far reaching in its effect and will work a revolution in the methods now in vogue in the Patent Office. It is to the effect that for the purpose of determining with more readiness and accuracy the novelty of inventions for which applications for letters patent are or may be filed in the Patent Office, and to prevent the issuance of letters patent for inventions which are not new, the commissioner of patents is authorized to undertake the work of revising and perfecting the classification of patents and printed publications. It has been impossible with the force at command in the office to keep pace with the increased work of examination of applications and the arrangement, perfection and classification of the sources of information necessary to determine the originality of the alleged invention.

Algona, Ia., is preparing to advertise for bids for an electric light plant.

DEVELOPMENT OF THE TELEPHONE FIELD.

Illinois Telephone Association.

The annual meeting of the Illinois Telephone association was held at Mattoon, Ill., on June 9th, and an interesting and instructive conference between representatives of the manufacturing and exchange companies took place. When the meeting was called to order by the president, Dr. I. A. Lumpkin of Mattoon, the following-named members and visitors were present:

John G. Todd, Inter-state Telephone company, Tuscola.

Miss Anna L. Wingard, Champaign-Urbana Telephone company, Champaign.

C. J. Sabin, Champaign-Urbana Telephone company, Champaign.

George Hughes, Hume Telephone company, Hume.

A. M. Howell, Montgomery County Telephone company, Hillsboro.

J. W. Gay, Mattoon Telephone company, Mattoon.

Dr. I. A. Lumpkin, Mattoon.

W. C. Lumpkin, Coles County Telephone company, Mattoon.

J. J. Downey, DuQuoin Telephone company, DuQuoin.

J. S. Cuming, Central Telephone and Electric company, St. Louis.

Henry Shafer, Stromberg-Carlson Telephone company, Chicago.

I. J. Kusel, American Electric Telephone company, Chicago.

J. J. Nate, Standard Telephone company, Madison.

D. Newman, Central Electric company, Chicago.

C. P. Platt, Western Telephone Construction company, Chicago.

A. M. Higgins, secretary Citizens' Telephone company, Terre Haute, Ind.

J. M. Coffing, Marshall Telephone company, Marshall, Ill.

E. M. Harwood, Shelby County Telephone company, Shelbyville, Ill.

W. S. Ashmore, Eastern Illinois Telephone company, Oakland, Ill.

Mr. Higgins, who was invited to address the meeting, explained the conditions at Terre Haute, where extensive operations are now under consideration. He said that the independent interests of that section desired toll-line connections with all companies whose patrons did business in Terre Haute. The Citizens' Telephone company was capitalized at $100,000, and it intended to put in a plant that would be superior to the present Bell service.

On motion of I. J. Kusel, the secretary was requested to furnish the manufacturing companies with membership blanks and lists of members, to be carried by their traveling men, in order that they might secure new members for the association. The following-named representatives kindly volunteered their services: J. J. Nate of the Standard Telephone company, I. J. Kusel of the American Electric Telephone company, D. Newman of the Central Electric company, James S. Cuming of the Central Telephone and Electric company, Henry Shafer of the Stromberg-Carlson Telephone company and C. P. Platt of the Western Telephone Construction company.

The following-named officers were elected for the ensuing year: President, Dr. I. A. Lumpkin of Mattoon; vice-president, J. J. Downey of DuQuoin; secretary, Albert M. Howell of Hillsboro; treasurer, G. W. Hughes of Hume; executive committe, Dr. I. A. Lumpkin, A. M. Howell, J. J. Downey, John G. Todd and C. J. Sabin.

The next meeting will be held at DuQuoin on Wednesday, September 7th. John G. Todd and John W. Gay were appointed a committee to arrange a programme for the meeting, including addresses from prominent telephone men and a trouble box in which may be placed any questions that any member may desire to have answered, and such entertainment as the committee may see fit.

J. J. Nate of the Standard Telephone company made an informal address, in which he reviewed a number of telephone troubles and explained the workings of the national association. The necessity of first forming local state organizations, then state associations and finally the national association, was emphasized.

The association received five new memberships during the meeting, making a total of 30 active members.

Though the attendance was not as large as the officers had hoped it would be, they feel sure that all who were present were fully repaid for the time and expense involved. They feel greatly encouraged by the enthusiasm which was shown, and hope at the meeting in September at DuQuoin to have a much more interesting and profitable gathering. It is anticipated that with the experience thus gained, the gentlemen in charge of the next meeting can procure many attractive features.

Independent Movement in Pennsylvania.

The Independent Telephone company of Lititz has an application pending before the Lancaster, Pa., City Council for a franchise to operate a telephone exchange in Lancaster county. It is the intention of the company to use the instruments of the Pennsylvania Electric company, and in order to familiarize themselves with the system prominent residents of Lancaster were invited to visit the factory of the telephone company. Accordingly two special trolley cars, having on board about 50 persons, members of City Councils, city officials and business men, left Lancaster for Marietta to visit the company's plant, where the telephones are manufactured. At Marietta the visitors were joined by a few other invited guests, and together the extensive plant of the Pennsylvania Electric company was inspected. It was found to be admirably equipped for the manufacture of telephones, with a capacity of about 250 per week, and the facilities such that the output can be largely increased when business warrants it. The visitors were well pleased with what they saw, the tests of the Pennsylvania Electric company's telephone proving it to be a very superior instrument.

How to Select a Bridged-circuit Telephone.

By H. P. Clausen.

Builders of shoddy telephone apparatus nowadays find it difficult to palm off on the exchange manager telephone and switchboard apparatus that does not comply with specifications prepared by capable men skilled in the art of telephony. The independent telephone managers are beginning to realize that in order to place their plants on a permanent paying basis, some reliable means must be adopted for enabling them to equip their systems with good substantial apparatus. Nothing demonstrates more forcibly the absolute necessity of providing a uniform method of selecting this equipment than the hopeless tangle in which toll-line systems that have been constructed at different intervals are sometimes found.

In certain sections of the country exchange managers have concluded to adopt a uniform class of apparatus for exclusive use on all interconnecting toll lines belonging to them. Furthermore, it is announced that representatives of exchanges interested in the adoption of this standard apparatus will conduct a series of tests with the telephone apparatus that may be submitted for their consideration, and determine by ballot which type shall be adopted. Such a plan would result in re-equipping many toll circuits, and would prove to be a costly experiment, if the balloting were not based on a technical knowledge of the apparatus under consideration.

What manner of test should be made and what information should be given the manufacturer when called upon to furnish instruments for such a test are important questions that should receive careful attention.

As a first consideration we will ascertain in what respects a bridged telephone differs from the instruments employed for series work. The transmitters, the receivers and induction coil we find to be alike; therefore we have only the signaling apparatus to compare. Selecting two complete telephones, one arranged for bridging and another for series work, we find it a difficult matter to tell which is which; of course, an examination of the wiring in the respective instruments would serve as a guide. However, remove the generator and ringer from their support, mix them up, so to speak, and it will be found that the instruments cannot be identified by their outward appearance. In what respects, then, do the instruments differ? Selecting at random one of the magneto ringers, let us remove the electromagnets and make a somewhat closer examination. Then we may proceed to dissect all of the remaining instruments in a like manner, and, after tabulating the results of our investigation, we will readily perceive that there is a vast difference in them and that they were each wound for a different class of service. Referring to the table given below, it will be observed that the samples A and B represent magneto ringers and that C and D represent magneto-generator armatures.

	Kind of instruments.	R—Ohms	Size of wire.	Number of turns.
A	Magneto ringer..........	80	No. 30 B & S	4,600
B	Magneto ringer..........	1,000	No. 36 B & S	12,960
C	Generator armature....	275	No. 32 B & S	3,900
D	Generator armature.....	500	No. 34 B & S	4,500

Though the figures given in the foregoing table furnish enough evidence to enable one to identify the various pieces of apparatus, it may be mentioned that the series ringer is wound for 80 ohms resistance mainly on account of the retarding influence it exerts on the voice currents, which in a series system must necessarily pass through every ringer magnet in the circuit.

The 1,000-ohm ringer is intended to accomplish an object just the reverse of that of the series ringer, namely, to provide such a large resistance as to present an almost effectual bar against the passage of any voice currents. Moreover, the bridge ringer needs to be much more sensitive than the series ringer, and this result is obtained by the increased number of turns of wire on the ringer electromagnets.

Sample C is a magneto-generator armature wound to a resistance of 275 ohms. It is obviously intended for the bridged telephone line, as such circuits always require the largest possible quantity of current that can be produced by a given generator, delivering the current at a sufficiently high electromotive force.

The magneto-generator armature D, wound to 500 ohms resistance, is employed for series work. As a rule it is required to give but a very small amount of current, but the electromotive force produced by it must be comparatively high. Practically speaking, the series toll circuit offers much better facilities for ringing over long lines than the bridged circuit, but the advantages in favor of the bridged system, as regards the talking service, more than offsets the advantages gained in the calling service on a series line.

Nothing need be said regarding the requirements of a bridged-circuit telephone, excepting that if we have a given circuit and a fixed number of instruments connected thereto it is a poor manufacturer indeed who cannot furnish the requisite apparatus for rendering a satisfactory service. It is of course the signaling apparatus that requires to be particularly well made, and when employed for unusually long circuits the problem becomes more difficult. But even then it is merely a question of volts and amperes, for with a given instrument we know just how much current it is necessary to force through the windings of the electro-magnets to produce the desired results.

On long-distance lines, where the line resistance becomes an important factor, it is more difficult to supply the proper apparatus. The magneto generator must be wound so as to generate a sufficiently high electromotive force for forcing the required amount of current through the magneto ringer located farthest away from a signaling station. Therefore, in making a test the different instruments should be compared under exactly similar conditions, and what is more important, the conditions imposed should be as nearly identical with the conditions that it will meet on the actual toll-line circuit as can be secured. When the manufacturer is called upon to furnish instruments designed for bridged toll-line service, he certainly is entitled to such information as to how and under what conditions the instrument submitted will be compared with the instrument furnished by his competitors.

The testing and selecting of telephone instruments for a simple toll circuit is unimportant compared with the difficulties met with when it is necessary to select all the apparatus that will have to be provided in changing over from one type to another where toll-line apparatus is distributed over a large section of country. It is undoubtedly true that almost any type of instrument will give far better service when the equipment is uniform throughout than when different types are employed. It must be admitted that balloting by a score of exchange members can scarcely be accepted as an ideal system, and it cannot be expected to produce results equal in value to the adoption of a report by a committee of technical men after making a thorough investigation of all conditions that would be met.

Independent Telephone Association.

The Independent Telephone association will hold its annual meeting in Chicago June 30th. The sessions of the convention will occupy three days, and it is believed that there will be a large attendance. The Palmer House will be the headquarters of the organization during the convention, and the meetings will be held there.

The time and place of the meeting have just been decided by the advisory board, consisting of James M. Thomas, Chillicothe, O.; William J. Vesey, Fort Wayne, Ind.; H. D. Critchfield, Mount Vernon, O.; C. R. Savidge, Sunbury, Pa.; J. C. Duncan, Knoxville, Tenn.; S. G. Higgins, Saginaw, Mich.; Hugh Dougherty, Bluffton, Ind.; Thomas R. Marshall, Keithsburg, Ill., and Edgar L. Miller, Frederick City, Md.

The officers of the association are: President, James M. Thomas, Chillicothe, O.; first vice-president, H. C. Young, Columbia, Pa.; second vice-president, L. K. Hime, Oskaloosa, Ia.; third vice-president, Thomas Fricker, Ashtabula, O.; secretary, W. J. Vesey, Fort Wayne, Ind.; first assistant secretary, G. W. Beers, Fort Wayne, Ind.; second assistant secretary, D. C. Dow, Cobleskill, N. Y.; treasurer, L. A. Carr, Durham, N. C.

Judge Thomas says that the proceedings will be confined strictly to the business of the organization and that the meetings will be open to members only. All independent telephone men are entitled to membership in the association upon meeting the requirements.

Pretty Telephone Girls.

There is a little telephone girl in Brooklyn who will do well to look to her business affairs if she does not wish to close them up with some celerity, according to an eastern contemporary. A telephone girl requires some other attributes than beauty; in fact, beauty may be a decided detriment to business. A business man in a hurry, as business men usually are, went in into a pay station the other day over in the eastern district to telephone. He gave his number and then he waited, not very long, but long enough to annoy him, and he rung up, to be answered after awhile that the line he wished to use was engaged. Each time he rung he received, after

awhile, an answer, but no information was volunteered. He was angry.

"I have telephoned from all parts of the city," he said to the proprietor of the pay station, "and I never have had such bad service before."

"Yes, it has been bad lately," said the proprietor. "The agent was in not long ago and wanted to know how the service was. The girl on this line, he said, was very pretty and attractive and had many admirers, and he had to look out for her. The service had been all right, and I told him so, but I shall have to give another report next time."

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

The Northwestern Telephone company has constructed a telephone line from Elma, Ia., to Deerfield and Charles City.

Work is to be begun at once on the line of the Rocky Mountain Bell Telephone company from Missoula, Mont., to Wallace, Idaho. The people of Coloma and Garnet want to get connection with Bearmouth, and offer a $500 bonus toward the construction of the line.

The Mankato Citizens' Telephone company has been granted a franchise for a telephone exchange in Mankato, Minn., and will begin work at once.

The Minnesota Central Telephone company has made slight reductions in its long-distance tolls.

A survey is being made for a telephone line from Spring Green, Wis., to Dodgeville.

The Central Minnesota Telephone company is working toward Minneapolis from Litchfield, Minn.

The council of Duluth, Minn., has given the Board of Public Works power to remove all telephone and telegraph poles in the city that are not in use, on condition that 30 days' notice is given to the owners and three weeks' notice by publication.

A telephone company has been incorporated to connect Shelly, Minn., via Caledonia, N. D., with the Edmonds and Hurley farms and Hillsboro, N. D. The line is to be put in operation at an early date. Its title is the Hillsboro, Duane, Caledonia and Shelly Telephone company.

The Mississippi Valley Telephone company has begun setting poles in Muscatine, Ia.

The telephone line from Mount Ayr, Ia., to Watterson, Ringgold, Caledonia and Hatfield, Ia., is completed.

Dr. Stewart of Chariton, Ia., is negotiating with the Mutual Telephone company of Indianola, Ia., to build a line to connect with the Chariton line at Lacona.

Arrangements have been completed by which L. S. Taintor of Menomonie, Wis., has bought the interest of James E. Keelyn in the Eau Claire Telephone company and the Chippewa Falls Telephone company and satisfied the claims against those companies held by Messrs. Heafield and Hills. The latter recently brought suit and attached the exchanges.

The Western Electric Telephone company is building a telephone line from Mankato, Minn., to St. Peter.

The Eastern Wisconsin Telephone company has been granted a franchise at Fond du Lac, Wis.

A Duluth, Minn., party contemplates extending a long-distant line to Two Harbors, Minn.

The E. H. Martin Telephone company of Webster City, Ia., has ordered a new switchboard of improved pattern.

The Northwestern Telephone Manufacturing company of Milwaukee has been granted a franchise for an exchange at Albia, Ia., subject, however, to the approval of the voters at the next election.

The Mutual Telephone company will connect with North Branch, Ia.

A local telephone exchange is proposed at Lisbon, N. D. The citizens are dissatisfied with the Forman Telephone company.

The People's Telephone company is putting in a toll line between Plattsburg, Ia., and Lathrop.

Work has been begun on the new telephone exchange at Centerville, Ia., and it is expected to have the system in operation by August 1st.

The Hilger-Fergus telephone from Lewistown, Mont., to a number of ranches is completed and in operation.

The Iowa Telephone company has been granted a franchise at Dysart, Ia., conditional on the people ratifying it.

A new telephone exchange is projected at Le Mars, Ia. A large number of subscribers have been secured.

The council of Des Moines, Ia., has passed a resolution forbidding the Iowa Telephone company (Bell) to use poles in the city, because it has no franchise. The city solicitor was instructed to commence a suit against the corporation if the resolution is not complied with. The council wants lower rates and takes this means of getting them.

The moving of a large building in Oshkosh, Wis., brought grief and trouble to the Northwestern Telephone company and the Citizens' Traction company recently. The building was too high to pass under the telephone and trolley wires, and they were lowered. In moving the building a pole was broken and the wires broke and became entangled, and the result was to cut off the South Side from telephone service and interfere with street-car traffic.

The Minnesota and Dakota Telephone company has been incorporated at Aberdeen, S. D., with a capital stock of $50,000. The Dakota Central Telephone company and the Minnesota Central Telephone company are both interested in the new company.

English Telephone News.

The telephone question is occupying a good deal of attention in England nowadays. There has been published in pursuance of the order of the House of Commons a copy of the agreements entered into on March 25 and 26, 1896, between the postmaster-general and the National Telephone company for the transfer of the trunk lines. The features of the greatest interest will probably be the exchange or "terminal" charges provided for where a telephonic message is transmitted over the trunk wires between an exchange of the National company and an exchange of the Postoffice or some licensee other than the National company, and another clause, which says that the agreement shall not prejudice or affect the right of the postmaster-general to establish telephonic communication himself or license others to do so. The abstracts show that the transfer of lines amounted to nearly 30,000 miles of wire, and when to these are added the lines built by the Postoffice, it will be seen how important a branch of the Telegraph Department the trunk telephone lines have become.

As a result of the agitation of the telephone question in Great Britain, a Parliamentary telephone inquiry has been ordered in the House of Commons, and a select committee appointed to "inquire and report whether the telephone service is or is calculated to become of such general benefit as to justify its being undertaken by municipal and other local authorities, regard being had to local finance, and, if so, whether such local authorities should have power to undertake such service in the districts of other local authorities outside the area of their own jurisdiction, but comprised wholly or partially in the same telephone area, and what powers, duties and obligations ought to be conferred or imposed upon such local authorities." The evidence taken before the select committee on the telephone service in the session of 1895 and the report of the commissioner and the evidence taken before him in the inquiry recently held at Glasgow are referred to the committee for consideration in so far as they relate to the subject of the present inquiry. The committee consists of 17 members, and is authorized "to send for persons, papers and records." Sir James Ferguson, a director of the National Telephone company, had been originally proposed as a member of the committee, but he preferred not to serve.

At the first meeting of the committee Sir Robert Hunter, solicitor to the Postoffice, was called, and the chairman inquired what was the position of the postmaster-general as to the telephones, first with regard to the public, and secondly as to the licensees? In reply, the witness related the proceedings of the government in the early days of telephony leading up to the litigation against the Edison Telephone company, in which a decision was given which bound both of the companies then in the field. Immediately after that decision was given the expediency of granting licenses was considered, and the government decided, in preference to buying up the whole of the patents and taking into their own hands the whole system of communication, to grant licenses. The postmaster-general accordingly granted licenses. No monopoly was granted, and no special way leave was granted to the companies. Until 1892 there had been several competing companies in the field, having no limitation on their rights as the gas and water companies had, and able to regulate their own charges, but in that year the two then existing companies—the National Telephone company and the New company—came to an arrangement by which it was provided that the government should take into its own keeping the trunk lines of communication, leaving the telephonic exchanges in the hands of the company. The National Telephone company had a right to carry on communications with any urban district. Then the question arose of areas, or tracts of country lying more or less in connection with urban districts. The area of London was 20 miles square, or 400 square miles. If a telephone company were guilty of systematic or intentional delay in forwarding communications it would be a breach of agreement with the Postoffice.

It was denied that the Postoffice had connived at the amalgamation of the two companies. It might have known what was happening, but it did not assist in it, and had no power to prevent it.

The witness expressed the opinion that local authorities could not spend money on a telephone system without a special act of Parliament. There was no doubt that if they had such an act there would be nothing to prevent them from working in the same area as the National Telephone company. He thought that the National Telephone company might refuse to connect with the local system. They could not refuse to transmit a message from, say, London to a provincial town, because that would go over a trunk wire, and it would be contrary to the agreement with the Postoffice to refuse such a message. The Postoffice had always told the National company and every other telephone company that the Postoffice was free to give competing licenses.

It was further developed that the Postoffice had taken legal opinion as to whether a telephone service could be established by a municipality which did not use the ratepayers' money. It had been decided in Scotland that what was called the "common good" could not be used for this purpose. It was not known whether the corporation of London or any other corporation which possessed funds which were not in the nature of a trust could establish such a system.

It is proposed to hold a conference of representatives of local authorities on the subject of the telephone system, in view of the appointment of a select committee of the House of Commons to inquire whether the telephone service should be undertaken by municipal and other local bodies. The local authorities of London have been invited to appoint representatives to attend at the investigation and to confer with the select committee as to the needs of London in the matter of the telephone service.

The London County Council and the National Telephone company seem to have considerable difficulty in reaching an understanding. Pending the report of the government select committee on telephony, the highways committee of the council recently expressed the opinion that it would not be well for the council to proceed further with reference to the proposed agreement with the National Telephone company in regard to the conditions under which permission had been given in certain cases for the placing of telephone cables underground. The committee thought, however, that as under the conditional consents the company had executed certain works the company should be required to enter into an agreement embodying certain conditions in regard to the works already carried out. The committee, therefore, recommended that the telephone company should be requested to enter into an agreement undertaking (1) to alter any telephone line if and when required by the council, and (2) that if and whenever the council desired to adopt electric traction on any tramway belonging to or leased by or under the control of the council, which passes along any street or part of a street in which any line of the company is laid, the council may require the company to alter any such line, or portion of such line, or to remove the same to such position as the council may require, and thereupon the company shall, without any claim for compensation against the council or its lessees, proceed to make such alteration in the position of such line; as no earth return but a complete metallic circuit is provided and used, the council or its lessees shall not be liable to the company for any interference with, or prejudicial effects produced upon, the cables or wires or the working of the same, or upon the operations of the company, by reason of such use of electricity upon such tramway. This subject will probably afford matter for discussion for several months.

Telephony in Switzerland.

In Switzerland the government controls the telephone, this branch of the public service being a part of the Telegraph Department. The Berne exchange has 2,025 subscribers, the average length of wire per subscriber being computed at 1,093 yards. Originally the subscripton was fixed at £4 16s. for the first year, £4 for the second, and £3 4s. for the third and succeeding years, these sums entitling the subscriber to 800 communications annually, but the subscription has been lowered to £1, £2 16s. and £1 12s., with an additional charge of ½d. for each communication, whether day, night or Sunday, so long as communication is required only between stations having a permanent service. Communications for other stations are taxed at 2½d. per communication; and between the hours of 2 and 5 a. m. 5d. per communication. The charge made for supplying and working subscribers' instruments is £4.

It is remarked by an English contemporary that telephone subscribers in Great Britain would look upon this as a somewhat complicated and troublesome system, and might even prefer the more expensive but less involved British method. The Englishman prefers to know the gross amount he is liable for in connection with his business arrangements. The same comment is applicable to this country.

The wages of the ordinary workmen engaged in connection with the telephone service range from 3s. to 3s. 6d. a day of 10 hours; the skilled workmen from 5s. to 5s. 6d., Sunday work extra, with fairly liberal provision in case of accident, illness and death. Women are employed as operators in preference to men, and receive a salary of from £48 to £72 per annum for a working day of seven to eight hours in winter and eight to nine hours in summer, with extra for night duty. Each operator attends to from 100 to 120 subscribers, and controls five inter-town trunk lines.

New Denver Exchange.

The remarkable increase in the telephone business of the residence district in the city of Denver, has made it necessary for the Colorado Telephone company to build a sub-station at the corner of York street and Colfax avenue. The one-story and basement structure will be completed by July 1st, and will have a capacity of 2,100 subscribers, but at the outset probably not over 250 instruments will be connected to the exchange. The sub-station is located about two miles from the company's building on Lawrence street, and the two exchanges will be connected by trunk lines.

Public Lighting in Relation to Public Ownership and Operation.[1]

By Alex Dow.

This paper is written to set before the association a proposed policy. It is not a new policy in its parts, neither is it an untried policy. It is applicable immediately to public lighting; that is to say, to the lighting of streets and public places under contract with, or on account of, a municipality. Ultimately its application may be more extensive.

It is the belief of many members that the National Electric Light association should formulate and publish a well-considered method of dealing with this business. While local conditions differ, there is no local difference in the principles which should govern electric-lighting companies in their dealings with municipalities and municipalities in their dealings with electric-lighting companies. An authoritative statement of these principles is needed. A statement by the association may be accepted in the first place only by the electric-lighting companies, but if the principles so stated are intrinsically correct, their acceptance by the municipalities must follow. No city government will persist in a course that is plainly inequitable. City governments have in certain cases acted inequitably in the matter of public lighting, but their action has not been plainly inequitable. In such cases principles have been obscured by details or by personalities, or have not been distinctly understood by the parties on both sides of the case. The public does not seek to be served at the expense of the individual. Public opinion may at times be biased, but it intends and endeavors to be just. And under our scheme of government public opinion is the final authority; and an appeal to public opinion is the ultimate means of redress for any grievance.

The advocates of municipal ownership have long recognized the value of public opinion and have presented their case both to the people of the country at large and to the citizens of selected municipalities through magazine articles, newspaper discussions, and addresses to public gatherings. Some of our members have met these arguments in kind and have confuted extravagant statements by the presentation of facts. But the man who is plainly arguing in his own interest is handicapped in a debate before a non-judicial tribunal as against those who claim to be disinterested. And it is not to be denied that the arguments which have had most influence on public opinion in this matter are those of theorists who certainly believe that they are doing the world a service, who are usually misinformed, always impracticable, but thoroughly in earnest.

A declaration of principles by this association and the recommendation to its members of a policy based on those principles would have greater weight with the public than the statements of individual companies, and would be accepted as authoritative over a wider area. But even if not accepted by the public its immediate acceptance by our own members will be useful. That each member must act for himself is a consequence of the conditions of our business, but that all should act on similar lines is possible and is desirable. Each of us looks to other cities than his own for light on problems which are new to him. Each of us, by a successful solution of any problem, benefits the industry at large, and, on the other hand, he who fails to appreciate and to properly deal with such a problem as this, injures, by his failure, not only himself, but all of us. Therefore it is well that we should agree on general principles and that we should advise with one another on special cases.

Let me make this general statement more specific. The member of this association who by good service, by close figuring of expenses and of profits, and by clear statements and logical arguments, convinces the authorities of his own city that it is to their interest to leave their public lighting in his care, has done all of us a service. The member who, on the other hand, fails to recognize the drift of opinion among his fellow citizens, who tries to convince them that unsteady and uncertain lights are worth a high price, who depends for the retention of his city-lighting contract on an appeal to the technicalities of his state law, or to the pockets of the venal members of his local board of aldermen, and who thereby brings about the erection of a municipally owned electric lighting plant and the publication of the bare running costs of that plant in parallel columns to the prices which he wished to charge—the member who does these things which he ought not to do, and leaves undone those other things which he ought to have done, is a detriment to the industry throughout the entire union.

I have indicated why I believe a declaration of principles and of policy is desirable. The principles to be declared will need little discussion, but the policy which to me appears best, may, when examined by others, appear to require amendment, or even radical change. It is offered to you for consideration in the belief that it is logical and that it is practical; but as a proposition for discussion and amendment, rather than as a perfected plan.

A Chapter of Electric Light History.

In the history of street lighting by electricity no chapter contains more profitable matter for study or for illustration of general principles than that which contains the record of the city of Detroit. That city was one of the first to use electric lights on its streets. It began in 1883 with 22 arcs, and in 1884 abandoned all other street lights. This street-lighting business was believed by those who first engaged in it to be a monopoly secured by patent rights; they found their mistake after much money had been invested under that belief; competition ensued; then consolidation, and finally municipalization of the service. I shall find it convenient to refer to Detroit for more than one modern instance.

In February, 1896, the city of Detroit owned 1,500 arc lamps and was operating 1,492 of these in the work of street lighting. In the same month the successor of the Brush Electric Light company, which installed the original 22 lamps in 1883, and which, until 1890, lighted the streets under contract, owned 1,049 arc lamps, and used in private lighting 433 of that number. Another company, organized in 1890 to compete with the Brush Electric Light company, owned 1,330 arc lamps and was using in private lighting 38 of these. In each case there accompanied the arc lamps a sufficient number of dynamos, engines, boilers, etc., and a building fully equipped for the operation of the number of lamps stated. At the same time the city had in use 134 towers, which had been formerly owned by the Brush company, and the other company was in the act of taking down and removing from the streets 104 similar towers, which had formed a duplicate of the Brush company's equipment. The necessary lines to connect lamps distributed over a large city had been owned by all three. The city had in use 329 miles of overhead wires, connecting to its 1,492 lamps. Neither of the companies had owned such a great mileage of line, but one had taken down lines and poles which had supplied 719 lamps, and the other was in the act of removing lines and poles which had connected 1,729 lamps.

Some of the Brush company's street-lighting equipment had been during the preceding five years diverted to the supply of commercial lights. Nevertheless, two-thirds of the equipment is to the present day a useless asset. Lamps which were bought at $40 have proved impossible of sale at one-tenth of the price. Dynamos which cost $2,400 cannot be sold to-day for $240. Lines taken down returned only a small percentage of their cost to the treasury. The towers which this company sold to the city did not bring their original price—that goes without saying—but they brought a fair price.

The loss of the second company was greater. Changes in the business had made their street-lighting arc lamps unavailable for commercial use, or almost entirely so. Similar changes had made their dynamos a slow asset. The engines were partially diverted into commercial service and the boilers entirely so. The wire taken down was not of a size that would fit in to their commercial-lighting system and the poles hardly paid for the labor required for their removal. The 104 towers—one of the heaviest of all the original expenses—had to be sold as scrap iron.

Destruction of Values.

It is clear that a loss to some person or persons was involved in condition which reduced machinery and lines capable of supplying 2,000 arc lamps to approximately their junk value. Leaving out all questions as to personal fault—neither affirming nor denying that the loss fell upon those for whose economic blunders it was the inevitable punishment—it is certain that there was a loss to the community at large; that property which might have been and which had been capable of doing good service to the public, was as surely destroyed as if it had been swept out of existence in a great fire.

It may be asked on whom did the loss fall? In social economy the loss of one is the loss of all, but to our customary modes of thought there appears a difference between losses borne by ourselves immediately and those which are apparently borne by other people. In this case the greater part of the loss was borne by business men of the city of Detroit. It was a reduction of the available capital of men engaged in productive industry in the city. This reduction—this absolute loss—after correcting for inflated values which should have been written off long before the period of liquidation; after correcting for securities issued for cash at less than their face value, or for considerations which were valued at more than their true worth, was not much less than $400,000.

I do not ask you to sympathize with the immediate losers, but I ask you to remember as my argument proceeds that this loss came about in consequence of business methods and of social tendencies which are in active operation to-day in nearly every town represented in this association. And I submit as a principle not admitting of dispute, that the duplication of an effective equipment for public lighting is an economic error, entailing loss of available capital to the extent of the duplication.

Improper Competition.

The first error in Detroit was the offer to the city of competition for the public-lighting contract. The men who made the offer knew perfectly that their success would mean a heavy loss to the original contractors, but they were willing to make a profit through other people's losses. In this they disregarded a principle much older than the electric-lighting business, that which calls on us to do to others as we would that others should do to us. Some of these men doubtless thought that they were doing the city a service by providing competition, but the managers of the manufacturing concern which was the majority stockholder and chief promoter in the new organization had no such excuse. Their object was to sell machinery. I do not ask you to condemn these people now. They have reaped as they sowed, and the exploitation of competing lighting companies by manufacturing concerns is a thing of the past, although its consequences in the shape of inflated capital are likely to be a burden for years to come.

I submit as a direct application of the principle last stated, that competition for public-lighting contracts, for the execution of which there is already an effective equipment in existence, is not legitimate business. The corollary of this statement is that the price at which public lighting is to be performed must be determined by some acceptable means other than competitive bidding. In this there is a departure from the established method of municipalities, which now depend on competition for the setting of prices on all public services performed by contract.

Wanted: A Substitute For Competition.

In the absence of some other acceptable means of setting a proper price for public lighting by contract, public opinion will not tolerate the suppression of competition. A reference to Detroit illustrates this very well. When the second company had, by making a lower price and by meeting the demand of the public for the undergrounding of wires in the business district, secured a three-year contract for public lighting, its managers found themselves in a precarious position. It was apparent that at the term of the contract they would again have to reduce prices to meet the competition of the original contractor, who could not afford to have his plant standing idle. It was also immediately apparent that the idle plant would be, as far as possible, diverted into private-lighting work and would there also tend to reduce prices and to divide the available business. Legal questions as to patent rights added to the difficulty of the situation. An attempt to combine the two interests was plainly necessary, and it was made; but the inevitable personal soreness prevented a combination until the new company had completely duplicated the equipment of the old one.

Of course the public became advised of the cessation of competition, and the advocates of municipal ownership made the most of the facts and added much fiction. Long before the contract had expired it was plain to any careful observer that it could not be renewed at anything like the former figure, and that the tendency of public opinion was strongly to municipal ownership. It was a period of "reform"—I use the word in its political sense—one of those periods when the taxpayers, usually content to be bossed unquestioningly by the practical politicians insist on calling the particular bosses of the hour to an accounting and expect to find that they are rascals. And as the public's way of having an accounting is to discharge its servant first and take up the reckoning afterward, the public servants of such periods are quick to fall in with the drift of public opinion in order to show that they either do not deserve discharge or are fully justifying their appointment to their new situations. Politicians are wise at such times; lighting companies sometimes are very foolish.

So the cry went up that there was no such thing as competition in the lighting business; that the men engaged in that business all intended to rob the public, and that if they appeared at times to compete with one another, it was only a temporary falling out among rogues. And the public being told on the one hand that all existing lighting companies were composed of rascals, and on the other that all municipally owned plants were successes, made up its mind that its only salvation lay in municipal ownership.

You can see, and any careful student can see, that the suppression of competition was inevitable, because its continuation meant a cumulative loss to those engaged in it. Possibly the public might have been made to see this, although the time to have begun work on the public was before the first loss due to competition had been incurred. But to merely prove that competition was impossible would not have been enough. It must further be proved that competition was unnecessary, and the only way to do that was to offer good service at an acceptable price. Under the circumstances the price might have to be very low indeed, for the belief was abroad that the business was enormously profitable at the established rates. The figures sent forth by certain municipal plants were quoted as warranting this belief, but these could have been contradicted. It was possible to send to Bay City and to Topeka a competent engineer—say one of the professors of the University of Michigan—whose dictum would be accepted by the newspapers and their readers; and so obtain the true figures. It was possible to answer in a similar manner the argument based on the competing bid at the last letting of the contract. That argument was that any business which justified the erection of a complete manufacturing plant on the security of a three-year contract must be exceedingly profitable. The contract price was a good one, but it would not pay for the plant in three years, as the public of Detroit thought it would. A showing of the whole truth as to costs, certified by a recognized authority, and followed by a bid carrying a minimum profit, might

1. Read before the National Electric Light Association at Chicago, June 7, 1898.

have been accepted by the public as a substitute for competition.

Collision with Public Opinion.

And here was made the second great error of the electric-light companies. Their managers seem to have been the only people who did not see what was coming. They failed to keep in touch with their public. The public was absorbing all the fool figures that the wildest theorists could furnish, but never a figure deserving credence was offered in contradiction.* The public was damning the poor quality of the lights then furnished and was told that it did not know a good light when it saw it. The public was determined to have much cheaper lighting, yet when bids were asked for they were almost as far above a possible figure as the costs published by the theorists were below it. The only hope for the contractors was to secure the support of the more conservative elements by offering good light at a minimum rate. On their failure to do this, and to do it quickly and gracefully, municipal ownership was as certain as the coming of summer.

Some effort was made by the companies in the Legislature of the state and in the City Council to protect their interests, but these bodies, especially in a reform year, cannot be expected to go counter to a strong public sentiment. In this they are wise in their generation.

Would the public of Detroit, after the agitation for municipal ownership had become general, have approved of award of contract at a low price, or would it have insisted on municipal ownership as a matter of principle?

An answer to this is merely an expression of opinion, but I believe that had a low price been offered the agitation for municipal ownership would have been suspended and that the companies might have secured terms more to their interest than was the action actually taken. There were many people in Detroit who did not wish to see the experiment of municipal ownership tried, except as a last resort. There were a few people who believed in municipal ownership as a matter of principle. There were doubtless also a few who expected to reap a personal benefit from the establishment of the city plant. Nevertheless, the great majority of the citizens sought only to reduce the expense and to improve the quality of the public lighting, and cared nothing for city ownership, except as a means of reaching a desired end.

In other lake cities where the agitation was fully as strong, concessions on the part of the lighting company led to a continuation of the contract system. The case of Toronto is a notable one, because the municipal sentiment is exceptionally well developed there. The local company is now performing lighting for the city at a figure a trifle less than was estimated as the cost of operation of a city plant. At Cleveland the local company holds the business because it made a price so near to actual cost that there could be no possible saving in municipal ownership, and the price was accepted after a careful inquiry into costs in neighboring cities on behalf of the municipality. The recent case of Tonawanda is another instance of success won on the same lines. There the local company submitted figures made by a recognized authority, showing the actual costs of operation in several representative municipal plants, and followed these figures by a bid more favorable to the city than municipal operation. I am assured that in each of these cities, while the contract figures are low, the management of the local company considers the business ultimately, if not directly, profitable.

Reason for Public Lighting by Contract.

In these instances the local companies have retained their public-lighting business by demonstrating that it was to the interest of the municipality to let them retain it. In this they have put into successful practice the most important part of the policy which I advocate. I submit that the only sufficient reason why a municipality should contract with a private company for public lighting is that the private company can do the work, and is willing to do it, cheaper than the municipality can itself do it by the direct operation of a public-lighting plant. It is in order to show how this comes about.

Difference Between Public and Private Lighting.

There is no longer any question of the right of a municipality to own and operate its own public-lighting plant. Electric street lighting is a distinctly public service, which must be provided for by the municipality. It is a service to every citizen; is a sequence of the social conditions which constitute city life as distinguished from rural life, and can only be effectively performed on municipal account and under municipal control. Herein it differs from the electric lighting of private premises, and it is necessary to note the difference. Electric lighting is the cheapest as well as the best light for streets and public places. For private premises, on the contrary, electric light is not a cheap light under usual conditions. It is not now and it is not likely to become an illuminant of universal use to the exclusion of gas and oil. Why this is necessarily so is well known to the members of the association. To the general public it is a statement better proven by a couple of good examples than by a long statement of causes. In the city of Detroit there were, in 1897, according to the annual report of the Water Board, 52,219 supply connections to the city water mains and the "families" in the city were 54,945. Each "family" was certainly a user of artificial light of some kind. Illuminating gas of 18 candle power quality is sold in the city of Detroit at $1 per thousand cubic feet. The maximum price charged by electric-lighting companies for incandescent lighting is 14.4 cents per kilowatt-hour, including renewals of incandescent lamps; the minimum is four cents, and the system of charging makes the average price 10.8 cents per kilowatt-hour, which, allowing for difference in candle power, is equivalent to gas at $1.21½ per thousand cubic feet on the average, or to gas at $1.62 to the customer whose individual load factor obliges him to pay the maximum price. These are comparatively low prices, both for gas and electricity. Under these circumstances there are in the city of Detroit approximately 18,000 (?) customers for illuminating gas, and 4,000 customers for incandescent-electric light. What light do the remaining three-fifths of the possible customers use? It is safe to say that they use kerosene oil. It is also safe to say that there are very few cases where oil is used merely because gas or electricity is not available. The main cause of the use of oil is its lower cost. I need not say to this audience, although I have found it necessary to make the statement to other audiences which were entitled to be considered intelligent, that there is not the least likelihood of the production costs of kerosene oil, of gas and of electric light materially changing their ratios to one another. As to their selling prices, I think that the Standard Oil company is better satisfied with the profit which it makes on the sale of kerosene in Detroit, than is either the Detroit Gas company or the electric-light company in that city with its profits.

I submit, however a second example of the relative cheapness of gas and electricity, from which example the question of profit is eliminated. The city of Glasgow, Scotland, owns and operates its gas works and owns and operates its electric-lighting plant. Neither of them is intended to make a profit. I have in my possession signed communications from the managers of each department in which it is written that the price of gas is two shillings and two pence per thousand cubic feet, and that the price of electricity for incandescent lighting (not including renewals of incandescent lamps) is six pence per kilowatt-hour for the first hour's use of the demand, according to a Wright meter, and 2½ pence per kilowatt-hour thereafter. Making the same corrections as in the Detroit calculation and assuming that the incandescent lamps paid for as "extras" in Glasgow are as efficient as those furnished free by the Edison Illuminating company of Detroit, the Glasgow price for gas is 52 cents per thousand, and the Glasgow price for incandescent lighting is equivalent to gas at $1.35 at the maximum rate, and 56¼ cents at the minimum rate. The average is about the same as the Detroit average. I think this example from a city where municipal ownership has been most thoroughly exploited, and where the municipal management is above suspicion of inefficiency or corruption, proves beyond question that electric lighting for private use is a luxury, and as such must continue to be used only by those who can afford luxuries; that is to say, by a minority of the citizens of any municipality; not by a majority, much less by every citizen.

Therefore, while it is admitted that the lighting of the streets is truly a public service, which may be performed by the municipality for and on behalf of every citizen, the furnishing of electric light to private consumers is not a public service, but is essentially a service to a few individuals, and as such should not be undertaken by a municipality whose object is to perform only those duties which municipal society as a whole owes to itself as a whole. This principle should be clearly understood, and should be boldly maintained. It is necessary that a municipality shall undertake certain services, and it is possible that it may undertake others, but the propriety of its undertaking any service depends on whether that service is to the public or to individuals; to the many or only to the favored few.

Possibility of Low Contract Prices.

This leaves to private enterprise the supply of electric light to private consumers. In performing this service there will be built and equipped a power house; there will be organized an operating and a managing force; there will be constructed lines of distribution. All of these may be, and part of them certainly will be, adapted to the performance of public lighting, in addition to the service of private consumers. To whatever extent this double adaptability exists in the private plant, there will be duplication of equipment in any other plant separately established for performance of the public work. Moreover, it is peculiarly characteristic of public lighting operated all night that its addition to the ordinary work of a private lighting plant tends to reduce the average cost of the combined output. In these considerations rests the possibility of a contractor profitably performing public lighting for a city at or below the price at which the city can itself do the work, and yet it being to the interest of the contractor to undertake the business.

Let us for a minute assume that municipal engineering and management and municipal financing can be just as good as private engineering and private financiering. If they are not so, it is the fault of the municipality, because technical and financial skill and executive ability are for sale in the labor market and are purchasable by a municipality, even as they are by private employers. There remains only one evident cause which should tend to make the costs of a municipal plant differ from that owned by an individual or a company. That difference is that the individual proposes to make a profit and the municipality does not. Looking closer at the facts we find that the municipality must in most cases allow the equivalent to a profit, because a municipal plant is built by money borrowed at interest. In the case where the money is not borrowed, but raised by direct assessment, the municipality has prevented some of its citizens from profitably using the money taken from them by taxation to be invested in the lighting plant, so that even in the exceptional case the possible profit to the taxpayer on the money withdrawn from his business has to be considered. But the rate of interest on municipal bonds is usually less than the rate of profit which a private owner is willing to accept on money invested in the electric-lighting business. It is four per cent. as against six or seven or eight per cent. In the final analysis the difference between the cost of lighting by contract and that of lighting at cost by a municipally owned plant should not exceed four per cent. on the capital invested in the plant. I assume in making this statement that the rate of interest on city bonds is a fair measure of the profit that investors expect on a secure investment. If the investment in an electric-lighting plant were equally secure, the rate of interest necessary would be no greater. The security depends so largely on the policy of the municipal authorities that it may approximate to that of municipal bonds on the one hand; or, on the other, it may be of the same order as the stock of a speculative gold mine or a Klondike expedition. In saying that the difference should not exceed four per cent., I am to be understood as implying such conditions as take the investment out of the speculative class. I am also to be understood as implying that proper salaries for management have already been paid out of earnings, and that the profit mentioned is that payable to capital alone; in other words, an exact parallel to the payment of interest on a municipal bond.

Advantage of the Contractor.

It follows that if the organization and equipment of an existing plant engaged in the supply of electric light to private consumers is available for the purpose of performing public lighting, this maximum difference of four per cent. can be thereby reduced or even reversed. In every case the difference should be reversible. There are causes to be considered later which tend to the contrary, but the fact remains that there is no irremovable cause why an existing electric-lighting plant should not be able to perform public lighting at a less price than the municipality can do the work itself.

Disadvantage of the Contractor.

Of the causes which tend to the contrary, one is that the plant which has a contract for public lighting may have very little private service, or none at all. Some other plant in the same city may do all or most of the private business. This condition of affairs can be only temporary. The consolidation of the two plants is an economic necessity, certain to arrive in time. The only condition justifying the existence of two plants in the same city is that the city is so large as to make a division of territory desirable; and even in that case an operating agreement is to be preferred to complete independence.

The public has been told that consolidation of plants is not to the public interest. This is an error, and the way to prove it such is to give to the public the surplus profits of consolidation in the shape of lower rates and better service—either or both.

Another cause tending to handicap the contractor is that few municipalities will make contract for a long term of service. Even the advocates of municipal ownership who are willing to issue 20 or 30-year electric light bonds, and who will not write off more than three or four per cent. for depreciation of plant in making their estimates of city operation, will protest against a contract running more than a year or two. They claim for the municipal plant all the advantage of a secure investment, and simultaneously deny these advantages to the contractor. We know that the securing of a long-term contract permits the installation of the most economically operated machinery, and reduces the percentage of profit, which must be earned annually. The objection to the long contract, that it denies to the city any share in the profits of possible improvements effected during the term of the contract, can be met by so drawing the contract that the margin of profit shall plainly be reasonable to begin with, and that the city may share in the results of improvements in consideration of guaranteeing a similar reasonable profit on the investment to be made in such improvements. A 10 or 20 year contract with such a clause could be safely taken at a very low price.

A possible solution of this problem is city ownership of the plant, combined with operation by a contractor. I think that this plan may by and by become common. It involves too many details to permit of my discussing it at present.

The very worst handicap that a contractor may have to carry is excessive capitalization. Here it must be noted that many municipally owned lighting plants do not report all their capital expenditure, so that in carelessly made comparisons of fixed charges the contractor appears to have overstated his investment in order to increase the apparent cost of operation. Any comparison must be on an identical basis for capital as well as for operating charges. And for the purpose of adjusting

prices between municipality and contractor, only one basis for capital charge is acceptable; namely, the present value of the plant—in brief, a properly made inventory. This proposition is so radical that I state the reasons for it.

Capital Account.

The possible bases for a capital charge are as follows: First—The face value of the securities issued by the plant. That this is an impossible base of adjustment is too well known to all electric-light men. Second—The current market value of these securities. This is impracticable, because many securities are not on the market, and because the immediate earning capacity of a plant affects the price of its securities, and because—last, but not least—some securities are speculative rather than industrial. Third—The actual cost of the plant. This would be proper if all plants had been built at the same time and if no plant had been obliged to be rebuilt. As it is, the construction cost of two plants built, the one in 1888 and the other in 1898, the two of identical capacity and of similar type, may be to one another as two to one; the earlier plant may have cost twice what was paid for the later, solely because the reductions in the prices of machinery and material of construction in the last 10 years.

The only remaining possible base for a capital charge is the present value of the plant; and I do not think that any other can be made acceptable for the specific purpose of adjusting a price for public lighting. It does not follow that the capital account is to be readjusted to a corresponding figure. It is only requisite that the company accept as a proper profit on public-lighting business an allowance based on inventory value of the investment. It would be well for the industry, however, if all our capitalizations were brought near to present values. And one good result of revaluation would be a logical sequence; the depreciation of the investment from year to year would necessarily be admitted as a proper charge against revenue. If a profit is only to be allowed on capital sufficient to construct a plant at the comparatively low construction prices now ruling, any further decline in cost of construction must be considered an impairment of capital, to be made good before any profit can be paid. It is not to be understood that I expect an electric-lighting company to stop dividends or to reduce capital stock in order to make good in any one year an extraordinary depreciation charge, due, for instance, to the replacement in the year of old-type machinery with new, in order to meet a public demand for a higher grade of service. Such extraordinary charges must be financed according to well understood rules. The loss of value of the old machinery does not occur in an instant, but is a process continuing through several years. So far as is possible, this loss of value should be anticipated by charges made in advance, in other words, by the accumulation of a renewal fund. But where this has not been done, the charges should be distributed over a proper period with due regard to all interests involved, in other words, so as to secure the greatest good for the greatest number. The principle is all important. The detail as to how a proper depreciation charge shall be put on the books is a matter to be disposed of in the most convenient manner.

Conclusion.

Having recited my premises, I now state my proposed policy as a recommendation, as follows:

I recommend that the association declare by resolution:

1. That a municipality may properly provide for public lighting either by the ownership and operation of an electric-lighting plant, by the operation of a contractor under lease of a municipally owned plant or by contract with the owner of a private plant.

2. That the supply of electric light to private users is not properly a municipal function.

3. That the performance of public lighting under contract by a private plant in connection with the supply of electric light to private users is essentially the method of least expense.

4. That the existence of two electric-lighting plants in the same territory is an economic error tending to increase the cost of production, and thereby the selling price; and that the maintenance of competition is to the detriment of the public.

5. That public lighting by contract should be performed at the lowest price consistent with a reasonable profit on the value of the investment; that no electric lighting contractor should demand more than such a profit, and that each municipality should protect the contractor in the enjoyment of his profit and against impairment of his investment, in order that a minimum profit may become reasonable.

6. That in order to adjust prices in the absence of competition it is necessary that costs be ascertained and prices approved by a competent authority, acceptable to the public as well as to the contractor.

7. That in the absence of a constituted authority competent to ascertain costs and prescribe prices, members having public lighting contracts under consideration should endeavor to have the adjustment of the contract price undertaken by a temporary commission or arbitration committee, who will adopt as the basis of adjustment the principles set forth in these resolutions, particularly in resolution number 5.

8. That there is no essential difference in the organization of municipally owned plants requiring a different analysis of costs from that which is proper for private enterprises, and that the publication of the costs of municipal lighting plants, properly analyzed, is beneficial to the electric-lighting industry. Further, that the similar publication of the costs of private plants is desirable, but is at present impossible because of its advantages to actual or possible competitors.

In conclusion, I desire to say that the tendency of public opinion appears to be toward some interference by and on behalf of the public with corporations performing so-called public services. Such a tendency is a concomitant of our social progress. It is not merely a temporary surge, but is a part of a general movement. It cannot be withstood, but may be guided into proper channels. The general result of any such movement is for good, the damage which is done to individual rights is incidental, and is more often the result of needless opposition by the individual. In this matter of public lighting the right of the community to interfere is so evident that it has been one of the first subjects considered, and will be one of the first disposed of; and its priority in time will establish its disposition as a precedent for the future disposition of similar questions. There is immediate need for clear thinking and for well-considered speech and action—for speech telling the public that electric-lighting companies desire to do business according to the golden rule, and for action plainly in conformity with the speech. I believe that this association can appropriately speak for its membership, and that its members are willing to live up to the principles which the association may enunciate.

Discussion.

H. M. Atkinson, Atlanta, Ga.: I take it that it is not the purpose here to discuss specific cases or grievances. Such an association as this should adopt a platform enunciating its principles on this question, which by its conservatism, temperate tone, fairness and broadness will appeal to the taxpayer and intelligent voter. This platform should be carefully prepared, should avoid anything aggressive in its tone or calculated to excite the opposition of advocates of the policy. We should state that we are opposed to municipal ownership on principle, not alone as owners of electric-lighting companies, but as taxpayers ourselves. We should state the we are not engaged in a partisan fight, and not that whenever one of our members is attacked, he is of necessity right and must be protected, but that circumstances will solely govern the position we take in each case. We should state that after long experience and earnest study, we, as honest business men, believe that private corporate service under proper legislative control is far better than municipal ownership. We must distinctly state that we will not uphold our members unless they are honestly endeavoring to give the best service at the very lowest living prices, taking into consideration local conditions. We must show that private ownership under proper control means all the advantages of public ownership without any of the risks. We should emphasize the conditions of legislative protection as it exists in France and this country in Massachusetts. We should dwell on the depreciation and losses to which we have been subjected during the past 10 years and still are. We should counteract the prevailing idea of great profit in the business. We should condemn at the start high prices and the policy of those who exact them, putting ourselves on record that as street-lighting contracts cover long hours and much consumption that they should be treated accordingly.

We should adopt a standard system of accounts for ourselves, and advocate the adoption of such a system by every municipality—one that will appeal to all business men, interested or not. We should endeavor to show that cities adopting this policy are providing the soil upon which rings and corruption exist, and without which they cannot. We should counsel fair and accurate expressions of facts and figures on both sides, emphasizing the injustice done by careless, inaccurate, unstudied statements. We should urge more complete and adequate methods of bookkeeping in all municipalities. We should drive home in the minds of the people that a city's only source of income is through taxation or bond issues, which mean taxation perpetuated; that every dollar raised by the former method is costing them interest as much as the latter. We must urge that cities count cost as fully as private persons. Our fight, in short, is the fight for good and honest government. We must stand fairly on the platform that we, as taxpayers, as well as owners of electric-light works, are opposed to the policy of municipal ownership and operation, as our experience has shown us what it is. We must show how legislative control, requirements and penalties create a degree of responsibility which never exists as regards a municipal corporation; how elimination of the factor of self-interest is an effective barrier to economy in production or operation on the part of a municipal corporation, and always will be; that private enterprise will always outstrip municipal ownership in filling the gap between supply and demand; that under contract cost is limited to the price, and under municipal control cost is not limited. We should point out the difficulty of ever getting true statements of cost if this policy is inaugurated, as advocates of it will not willingly issue statements condemnatory of themselves, and politicians will not take action that will decrease their patronage. It should be pointed out to taxpayers and voters that municipal ownership of electric-light plants will only be a stepping-stone to ownership of numerous other industries, for if ownership of one is advisable, why not all?

We should educate public opinion to the unfairness of municipal competition with capital invited and encouraged to occupy the field when an industry is an experiment, as long as such capital furnishes good service at a fair price, and that such competition is equivalent to condemnation and confiscation of property without compensation.

Samuel Scovil, Cleveland: Each of us, I think, will agree with the statement that Mr. Dow makes in closing his able paper, that there is immediate need for clear thinking and for well-considered speech and action in reference to the attitude being assumed by the public toward those corporations performing so-called public services.

Most of will agree that in some measure the hostility in the public mind toward these corporations is the logical outcome of the methods which some of the companies have pursued, which in themselves are most reprehensible, whether they were adopted voluntarily or involuntarily. Nothing is to be gained by denying that this has been an important factor in bringing about the conditions with which we now have to deal. While willing to admit the truth of this statement, I hold, however, that the hostility alluded to is in quite as great a degree attributable to the teachings, misrepresentations and accusations of a certain school of theorists and dreamers whose one universal remedy for every political ill, real or imaginary, is to increase the functions of government.

Certainly this association can do its members no greater service, and incidentally the other corporations performing quasi-public services, than by adopting some plan of action looking toward an improvement in the relations of those companies which it directly represents with the communities which they serve. How best to accomplish this most desirable result is a problem not easy to solve.

In regard to public lighting only, Mr. Dow advocates a declaration of principles by the association and a recommendation by it to its members of a policy based on those principles. If his suggestion be acted upon, the association must be careful that the principles which it enunciates and the recommendations accompanying them shall be such that wherever they may be fully accepted and adopted they will result in reasonable prices being offered to the municipality and a fair return to the company upon its invested capital.

I use the words "invested capital" advisedly, for I take decided exception to the principle laid down by Mr. Dow, that the present value only of a lighting plant is the proper basis upon which to adjust a price for public lighting. The growth of the electric-lighting industry has been almost unexampled in rapidity, and as a natural sequence much of the apparatus originally installed in the average lighting plant has been replaced not once, but several times, because it had been obsolete. This was no ordinary depreciation such as might properly have been anticipated. It was extraordinary in its character and in a degree. For reasons well understood by you, it was impossible for the managers of these plants to secure a price for the service rendered by them which would allow them to cover this depreciation, even could they have anticipated it. As a case in point, I will state that I am informed that there is not in use to-day in the lighting plants owned by the city of Chicago one single piece of the electrical apparatus placed in service when the original plant commenced operation. It was the necessity of buying new equipment and charging its cost to operating expenses that made the cost of operating street arc lamps by the municipal plant of Chicago for labor and material only $96.40 per lamp per year. You will find these figures given as the cost on page 35 of the mayor's message for 1896.

Aside from this fact, the original investors in electric-lighting apparatus had to pay for patent rights, and these constituted no inconsiderable part of the aggregate amount of capital which they had to put into the business. In an article by the president of this association on the "Development of the Central Station," he says that in the early days of the business it was necessary to do the cheapest possible engineering and construction in order to meet the necessities of the slim exchequers of those who were bold enough to embark their capital in this business. There was no clamor then for the municipality to municipalize the industry.

Let us assume that a municipality had 10 to 15 years ago built a plant for itself. The municipality, if it kept its service up to date, would necessarily have had the same experience as did the private owner in reference to replacements. How would the cost of its plant compare with the cost of its replacement to-day? It could probably be duplicated for less than half its cost.

Now, if an expert were sent to that town to ascertain what it was costing it to do its public lighting, would he be justified in ignoring the total capital expenditures made on its plant and take only one-half of such expenditure, because the plant could be replaced to-day for that amount? To put the case another way. Suppose the municipality had issued bonds for the total expenditure on its plant, and these bonds, as would probably be the case, were now outstanding, no one would deny that the interest on such bonds would necessarily be a part of the cost of its public-lighting service.

This is in a measure the position which many of the private-lighting plants are in to day. Moreover,

it is a fact that it has been the very readiness of the private-lighting companies to replace and enlarge their original installations, and of the street-car companies to do likewise, that has made possible the great development both as to efficiency and cost of the electrical appliance of to-day. If the municipalities had undertaken the business entirely at the outset, it is not at all unlikely that the development and consequent extraordinary depreciation would not have been anything like as rapid.

As bearing upon this point, let me call your attention to some figures in an article in the March issue of Lighting, an English paper. The writer says that the extent to which street arc lighting has been taken up in England bears no reasonable proportion to the state of things which should really exist, and which does exist, in America, and then give tables showing that in the American towns in 45 states, having a gross population of 14,384,000, there were 60,397 arc lamps, whereas, in 31 English towns, with a population of 7,497,079, there were 3,864 arcs, or in America one lamp to every 250 people, as against one lamp to every 1,940 people in England.

As I understand it, the proposition made by Mr. Dow, if accepted by this association, might well be stated in a resolution, as follows:

"Resolved, That we, the managers of private-lighting companies, in convention assembled, deliberately declare that it is perfectly equitable that part of the capital which we have invested in good faith and with commendable enterprise be now confiscated by the municipality which we have been serving."

In this connection let me call your attention to the position taken by Professor Ely of the University of Wisconsin, one of the foremost and ablest of the advocates of municipal ownership. He says: "The mode of accomplishment (in changing from private to municipal ownership) of course requires careful consideration, but only a few suggestions can be thrown out at present. One of the most important is that a fair, but never excessive, value should be paid for the property acquired, and a fair value does not mean simply the cost of duplication of a plant."

The professor's position is simple justice. He recognizes the right of private owners to their investments.

Do not misunderstand me, gentlemen. I do not claim that a municipality should pay more for its public lighting than it could do the work for itself. What I do claim is that there is nothing in the history of municipally conducted industries, either at home or abroad, which would indicate that they can approach the privately conducted enterprises in economy of operation, if the municipality will grant and secure to the private company the same privileges and security that it assumes for itself.

As a well-known writer states it: "There is an economic advantage inherent in private ownership that cannot be acquired by a municipality. The operation of this advantage creates the profit for which the private company works, and which, when created, belongs to those creating it as justly as the pay for a day's work belongs to the honest workman. This economic advantage ceases to exist when an industry passes from private to municipal ownership. This advantage stimulates enterprise, induces thoughtful care and inspires energy."

The margin of difference between the two systems will, in my judgment, allow the private companies a reasonable return on the capital they have invested in their plants. To take the present value of these plants and oblige the private companies to furnish services on such a cost, is to assume that the municipality has a right to wipe out capital which it invited into its service, and then to take unto itself in addition all the economies that result from an intelligent self-interest.

There is one other principle which Mr. Dow asks us to accept, to which I think exception should also be taken. He says: "The only sufficient reason why a municipality should contract with a private company for public lighting is that the private company can do the work, and is willing to do it, cheaper than the municipality can itself do it by direct operation of a public-lighting plant."

In my opinion preference should in every case be given to the private company at the same cost. A contract made with a private company is a known expense. Municipal ownership and operation is an unknown expense. Aside from this fact, however, there is a larger and an all-sufficient reason why private enterprise should be given the preference, and individual effort be thereby stimulated.

The question as to whether the municipalities of this country shall own and operate their own lighting plants may seem to be a small matter, except to those whose money is invested in such plants. The axiom that it is the first steps which count is as true of a community as it is of an individual. Once fairly started upon the policy of the municipalization of all public utilities, and who can tell where governmental interference with individual effort will stop. Will it stop with the municipalities? No! Led by the theorists, dreamers and politicians, the unthinking masses will cry more, more, and the inevitable result will be the institution finally in our civic, state and national governments of a crushing bureaucratic system that will seek to regulate almost every activity of the individual from the cradle to the grave the substitution of the paternalism of a despot for the free government of a democracy. All history and experience show that wherever a people have intrusted their liberties to their representatives, to be exercised through a centralized power, these liberties have been lost to them. Instead, therefore, of taking any steps in the direction of the restraint of individual effort and private initiative, let us hold fast to the fundamental principle enunciated by the fathers of this republic, that the only government of a free democracy is limited to the preservation of order and the enforcement of justice.

The following would seem to be much more acceptable than Mr. Dow's proposition, and be more in accord with American institutions, which is to interfere as little as possible with the individual activities of the citizen.

"The best interests of the public welfare require that a municipality should contract with a private company for its public lighting, if the private company can do the work, and is willing to do it at a cost not greater than if supplied by a plant owned and operated by the municipality itself."

Northwestern Electrical Association.

[*Continued from page 359*]

the Calumet and Hecla Mining company has been sunk to the immense vertical depth of nearly a mile. Included in this vast mining property are engines of over 6,000 horse power, combined in one house.

After the inspection of the first installation, it being then afternoon, the party was driven to the Calumet armory, where lunch had been prepared by the Calumet and Hecla company. The delegates greatly appreciated the courtesies shown them by this company and were especially pleased with the kind hospitality of Captain Duncan and Electrical Engineer F. N. Bosson. Mr. Bosson will be remembered as one of the railway engineers of the Thomson-Houston company, who for several years was connected with the western railway department of the Thomson-Houston company, with headquarters in Chicago.

About 4:30 the Northwest was cast loose and started for Duluth, through the Portage Canal. This ride through the canal proved to be one of the most picturesque of the entire trip. Words cannot describe the natural forest beauties as seen from the deck of the steamer, as she slowly pushed on through this narrow waterway, with the green foliage on both sides almost within reach.

To say that the party was entertained at Duluth would convey but a poor idea of the hospitality extended. The mayors of Duluth and West Superior, together with their committees, literally gave the freedom of the town to the convention, and if kindness could kill, there would now be a number of deceased delegates. After the last regular convention meeting in the Duluth City Hall the members were taken on a most enjoyable coaching party over the hill boulevard, overlooking Duluth. Views of the town and harbor, as seen from the steamer, and also a picture of the coaching party on the boulevard, are presented in this issue. This delightful drive was finished about five o'clock, and the whole party was then landed at the docks, where a large boat in the tow of a tug conveyed the delegates about the harbor. About seven o'clock the party was landed at West Superior, and in charge of Mayor Dietrich, repaired to the hotel to prepare for the evening's entertainment. The banquet was a pleasant affair, and was attend by about 125 persons. Mayor Dietrich extended to the members of the association and other distinguished guests a hearty welcome and the freedom of the two cities. Mayor Deitrich then introduced Mr. Wilson G. Crosby, the toastmaster of the evening. Mr. Crosby responded in a happy speech. President Copeland was the first speaker. He was followed by Mayor Truelson, ex-Governor William R. Merriam, Professor Elisha Gray, F. B. Clark, Professor Fujioka and Thomas R. Mercein.

At noon Wednesday the party took the train for Minneapolis and arrived in time to partake of a dinner that had been prepared at the Minneapolis Mercantile club, through the courtesy of President Morgan Brooks of the Electrical Engineering company of Minneapolis. It was almost dark when the party took the coaches that had been provided by Mr. Brooks and was driven to the lakes through the parks of Minneapolis. At about nine o'clock the coaches landed at the train and the journey was concluded by the arrival in Chicago Thursday morning at 9:30.

Presentation to J. M. Hill.

One of the most interesting and pleasing features of the entire trip was that through which Master of Transportation Joseph M. Hill was presented with a token of the high appreciation felt by the members of the party for his efforts in bringing the trip to a successful conclusion. The members of the party were so much impressed with the care and thoughtfulness exhibited by Mr. Hill in planning the trip and carrying it out successfully in every detail, that while on the Northwest all hands contributed for some token of appreciation, and President Copeland and Secretary Mercein were appointed to elect something appropriate as a gift for Mr. Hill. In Duluth a scarf pin was purchased and held in reserve for presentation when a suitable opportunity was found. In Minneapolis, after the dinner at the Mercantile club, Secretary Mercein arose, and, in a few highly complimentary and well deserved remarks, told Mr. Hill how much credit was due him, and how highly all on board the Northwest had appreciated his work. The diamond scarf-pin was then presented to Mr. Hill, who responded in a few well-chosen words, saying that he really felt that the credit should not be given to him, but to all hands on board, for having united in making the undertaking successful.

Members and Guests.

Following is a list of the members of the association and their guests who left Chicago on the steamer Northwest:

Abadie, E. H.	St. Louis.
Adams, R. N.	Sault Ste. Marie, Mich.
Anderson, H. S.	Springfield
Arnold, B. J., and wife	Chicago.
Atkinson, H. M.	Atlanta.
Baker, John S.	Evansville, Wis.
Banks, W. B.	Superior, Wis.
Boyer, F. N.	Chicago.
Brooks, Frederick	Boston.
Brooks, Morgan	Minneapolis.
Brooks, H. H.	Boston.
Candee, W. L.	New York.
Carr, Robert F.	Chicago.
Caverly, Will	
Chandler, William	Sault Ste. Marie.
Church, J. V. S.	Chicago.
Cleland, Miss Eliza	Evansville, Wis.
Comstock, L. K.	Chicago.
Copeland, F. A.	La Crosse, Wis.
Cross, A. A.	West Superior.
Dailey, W. W.	Chicago.
Daniels, A. L.	Aultman, O
Darley, W. W.	Chicago.
Darling, Dr.	Sault Ste. Marie, Mich.
Dee, James R.	Houghton, Mich.
Desenberg, L. J.	Sault Ste. Marie.
Dietrich, Mayor	West Superior.
Doane, S. E.	Marlborough, Mass.
Doherty, Henry L.	Madison, Wis.
Donohoe, F. E.	Chicago.
Dow, Herbert H.	Midland, Mich.
Downs, B. B.	Minneapolis.
Dysterud, E.	Monterey, Mex.
Easterday, Rev. G. R.	Sault Ste. Marie, Mich.
Edgar, H. T.	Boston.
Ely, J. N.	Atlanta, Ga.
Ferguson, Mr.	Sault Ste. Marie, Mich.
Ferris, Thomas	Milwaukee.
Fitzgerald, Mr., and wife	Duluth.
Frego, Charles H.	Hoopeston, Ill.
Friend, W. H., and wife	Vincennes.
Fujioka, Ichisuke	Tokyo, Japan.
Goodwin, H. D., and wife	Milwaukee.
Goodwin, Hugo P.	Milwaukee.
Gray, Elisha, and wife	Highland Park, Ill.
Hapeman, Douglas	Ottawa, Ill.
Harding, J. H.	Laporte, Ind.
Hartman, O. C.	Duluth.
Hergett, H., and wife	Pekin, Ill.
Heskett, R. M.	Green Bay, Wis.
Hill, J. M., and wife	Chicago.
Howell, Willson	Harrison, N. J.
Hull, J. W.	Steubenville, O.
Jennings, J. J.	Wilkinsburg, Pa.
Johns, S. C. D., and wife	Cleveland, O.
Kehler, C. S.	Chicago.
Kelliher, P. C.	Sault Ste. Marie, Mich.
Kimball, F. M.	Boston.
Kingman, W. F.	Sault Ste. Marie.
Kittle, E. B.	Chicago.
Knight, W. C.	Fort Wayne.
Knutson, J. B.	La Crosse.
Korst, P. H.	Racine, Wis.
Land, Edna	
Lang, A. E., and wife	Toledo, O.
Leland, C. F.	Duluth.
Loomis, J.	Cheboygan, Mich
Lowerie, W. M.	Chicago.
Mabbs, J. W.	Chicago.
Maloney, H. C.	Chicago.
Manson, G. T.	New York.
Marsh, Converse D.	New York.
McDonald, Mrs. S. D.	Chicago.
McDonald, J. J.	Chicago.
McGraw, James H.	New York.
McKinlock, George A.	Chicago.
Mercein, Thomas R.	Milwaukee.
O'Connor, Wallace	Chicago.
Osborne, Chase S.	Sault Ste. Marie, Mich.
Packard, W. D.	Warren, O.
Page, A. D.	Harrison, N. J.
Barker, W. F.	Boston, Mass.
Parker, Miss	Evanston.
Paul, A. G., and wife	Chicago.
Perrin, Mr.	West Superior
Perry, F. L.	Chicago.
Phillips, F. N.	Providence.
Pierce, Mr.	Negaunee
Price, C. W.	New York.
Randolph, L. S.	Blacksburg, Va.
Rex, George	St. Louis.
Ripley, Joseph	Sault Ste. Marie, Mich.
Ross, C. A.	Chicago
Ross, Max	Chicago.
Rugg, W. S.	Chicago.
Scanlan, P. H., and wife	St. Paul, Minn.
Schayer, J. J.	Chicago.
Scovill, S., and wife	Cleveland, O.
Simons, O. H.	Duluth.
Slate, H. C.	Milwaukee, Wis
Smith, H. E.	Duluth.
Smith, W. S.	Toledo.
Stacey, Thomas I., and wife	Chicago.
Stern, M. L.	Denver, Colo.
Taylor, F. L.	Duluth.
Truelson, Henry	Duluth, Minn.
Underwood, H. G., and wife	Milwaukee.
Upham, W. P.	Chicago.
Wagner, H. A.	St. Louis.
Warren, Arthur	Pittsburg.
Wetzler, Joseph, and wife	New York.
Wigh, Edith	Hancock.
Wigh, Charles	Hancock.
Wilkinson, C. D.	Chicago
Wilkinson, Samuel	Northville, Mich
Williams, Charles P.	La Crosse.
Williams, George V.	Chicago
Willson, R. A.	Marquette
Woodbridge, J. E.	New York
Wurts, A. J., and wife	Pittsburg

Convention Notes.

H. L. Doherty of Madison was there in good voice and fine feather.

The Columbia Lamp company of St. Louis was represented by Guy. F. Williams, who is traveling

in Minnesota, Iowa, Wisconsin, Nebraska, Missouri and Illinois.

Warren, O., was represented by W. D. Packard, of Packard lamp fame.

A. J. Wurts, of lightning arrester fame, was accompanied by Mrs. Wurts.

Prof. Elisha Gray and wife of Highland Park, Ill., were among the distinguished visitors.

Sault Ste. Marie was well represented in the persons of L. J. Desenberg and W. F. Kingman.

James R. Dee of Houghton, Mich., the man that knows all about copper, did the honors for his city.

Converse D. Marsh illuminated the whole ship. Of course the Bryan-Marsh lamp had nothing to do with this.

H. F. Edgar came clear from Boston, and H. M. Atkinson thought enough of the convention to run up from Atlanta, Ga.

Mrs. Joseph Wetzler accompanied her husband on the Northwestern trip. Mrs. Wetzler is an accomplished musician.

Capt. Willard L. Candee, George T. Manson. George A. McKinlock and Charles W. Price promenaded the deck together.

"Tom Ferris," the General Electric representative, carried the company's banner through the wild Northwestern territory.

H. G. Underwood, the well-known patent attorney, was one of the Milwaukee contingent. He was accompanied by Mrs. Underwood.

That popular "G. E." man, F. N. Boyer, did the honors, and did them well, for Western Manager B. E. Sunny of the General Electric company.

Col. Copeland, president of the Northwestern association, will be remembered as having headed the most unique convention that ever "went on the road."

E. B. Kittle, now representing the Sprague Electric company as western manager, with headquarters in Chicago, made his first Northwestern convention trip.

E. Dysterud of Monterey, Mexico, proved a typical man from Mexico. Mr. Dysterud came all the way from Monterey, and nobly did he do the honors for his country.

George Rex, the popular representative of the Columbia Lamp company, took the place of Secretary A. C. Garrison, who was compelled to return after the national convention.

A number of ladies went as far as Milwaukee. Among these might be mentioned the Misses Parker, who were the guests of Mrs. Stacey; Mrs. Scovil of Cleveland and Mrs. Frank L. Perry of Chicago.

Frank L. Taylor, proprietor of the Spalding of Duluth, joined the party at Chicago, and accompanied the visitors to Duluth. Mr. Taylor won much applause by his most skillful sleight-of-hand entertainments.

Prof. Ichisuke Fujioka of Tokyo, Japan, was voted not only a man of rare scientific attainments and great sociability, but a "good fellow" as well. The professor made the hit of the evening among the speeches at the Soo.

The Central Electric company's Northwestern representative, W. P. Upham, was on board. Mr. Upham added a great deal to the pleasure of the ladies, assisting in the games and proving himself generally a good fellow.

A. L. Daniels of the H. B. Camp company of Aultman, O., who had been in attendance at the National convention in Chicago, went on to Duluth with the steamboat party. Mr. Daniels added to his already large number of friends.

Mrs. W. H. Friend of Vincennes won the second shuffleboard prize on Monday afternoon; it was an electric curling iron of unique pattern that had been presented through the courtesy of the Electric Appliance company of Chicago.

H. T. Edgar of the Jandus and Buckeye interests in Boston left his partner, Cooke, behind, and did the convention alone. Mr. Edgar is a Bostonian with a keen eye to business. He was warmly welcomed by his "Indian" friends.

Supt. S. E. Doane of the Bryan-Marsh lamp factory accompanied President Marsh. Mr. Doane's paper was most interesting and was greatly appreciated by all those interested in the minutiae of the science of incandescent lamp manufacture.

R. B. Snyder of the Superior Leader and Representative Miller of the Duluth Herald gave most excellent and correct reports of the proceedings, and did all in their p[illegible] pleasant the stay of the delegates in their respective cities.

Manager Arthur Warren of the advertising department of the Westinghouse company seized the opportunity of making himself acquainted with the Northwestern contingent. Mr. Warren recently took charge of the advertising department of the Westinghouse company. It is to be hoped that Mr. Warren will not let this be his last Northwestern convention.

W. W. Darley, representing Manoz & Darley, the Rookery, Chicago, reminded all that the Cahall water-tube boilers, manufactured by the Aultman & Taylor Machinery company, Mansfield, Ohio, were just the thing for electric-lighting service.

C. D. Wilkinson of Chicago, better known as "Western Electric Wilkinson," in company with L. K. Comstock, were made welcome. Messrs. Wilkinson and Comstock had a hard time to escape from their friends, especially at the Soo.

Abadie of St. Louis was everywhere, and with a smiling countenance, always full of life and geniality, he never lost an opportunity to keep the Wagner specialties to the front. Herbert A. Wagner accompanied the steamboat party as far as Milwaukee.

Henry D. Goodwin and Mrs. Goodwin, together with their son, Hugo P. Goodwin, were among the passengers. Mr. Henry D. Goodwin is the stenographer of the association. Mr. Hugo P. Goodwin won much praise for his skillful work on the piano.

President Morgan Brooks of the Electrical Engineering company of Minneapolis, in company with L. S. Randolph of Blacksburg, Va., and his brother, Frederick Brooks of Boston, Mass., represented the greatest city in the Northwest, to say nothing of "the greatest supply house" of the Northwest.

Secretary Thomas I. Stacey of the Electrical Appliance company enjoyed the trip hugely. Mr. Stacey was accompanied by Mrs. Stacey and the Misses Parker, one of Evanston and one of Iowa. The Electrical Appliance party also included the company's Minneapolis representative, B. B. Downs.

J. W. Hull, formerly of Steubenville, O., and more recently of New York and Chicago, attended, and was a universal favorite with the ladies on board the Northwest. Mr. Hull is the representative of the Cabinet Manufacturing company of Steubenville, O., that is now making a specialty of telephone woodwork.

P. H. Scanlan, the courteous and energetic traveling passenger agent of the Chicago, Milwaukee and St. Paul Railway company, was one of the most welcome guests on the Northwest. Mr. Scanlan had been delegated by his company to look after the return trip of the delegates from Duluth to Chicago.

The newspaper men on board were Charles W. Price of the Electrical Review, James H. McGraw of the American Electrician, J. V. S. Church and J. Edwards Woodbridge of the Electrical World, Joseph Wetzler of the Electrical Engineer, Frank L. Perry of the Western Electrician and H. M. Swetland of Power.

One of the men warmly welcomed was H. H. Brooks of the Circular Loom company of Boston. Mr. Brooks, on arriving at the Soo, found that his reputation as an inventor had preceded him, and he came very near having to make a speech, but, owing to the absence of his friend Edison and his consequent lonely feeling, he escaped.

Mrs. Hill accompanied the energetic western manager of the Bryan-Marsh company. Mr. Hill certainly deserves the credit for having carried to a successful conclusion what was really a gigantic undertaking for so young an association as the Northwestern. Too much cannot be said of the delights of the trip, which he so carefully planned and so conscientiously carried to a successful finish.

Electrical Engineer B. J. Arnold succeeded in reaching Chicago in time to meet Mrs. Arnold and catch the boat. Mr. Arnold is one of the hardest workers among the electrical men in the West, and the engineering work on his new St. Louis central station has occupied his time so closely that it was feared he might not be able to attend the convention. He had a royal good time, though, as did Mrs. Arnold, and was apparently well repaid for his time.

The Northwestern Electrical association should feel highly complimented at the interest shown by the representatives of both Duluth and West Superior. Mayor Truelson of Duluth and Mayor Dietrich of West Superior met the association at Chicago. Mayor Truelson was accompanied by O. C. Hartland, C. F. Leland, F. L. Taylor, O. H. Simons and H. E. Smith, while Mayor Dietrich of West Superior had with him Mr. Perrin and A. A. Cross.

The meeting of the association on board the steamer Northwest will always occupy a prominent place in the history of the organization. Credit is now freely given to J. M. Hill of Chicago, to whom the association is indebted for one of its most enjoyable conventions. In planning the trip Mr. Hill took cognizance of the fact that the members looked forward to the mid-summer convention rather as a pleasure trip than as one to be devoted entirely to business.

President George A. McKinlock of the Central Electric company was in the party. Mr. McKinlock had looked forward to this trip ever since its inception, and the many friends of his company were glad to welcome him on this, his first Northwestern convention trip. For years Mr. McKinlock, owing to the great pressure of business, has been compelled to delegate a large proportion of the pleasures of such occasions to others, but this time he was on hand, and it is safe to say that it will not be his last trip, as he seemed to enjoy it hugely.

President F. N. Phillips of the American Electrical Works of Providence daily promenaded the deck, arm in arm with the future mayor of Edgewater, Ill. For the benefit of those who are not familiar with Chicago's suburbs, it may be said that Edgewater is a strikingly beautiful place, and one of the most aristocratic neighborhoods in the vicinity. Western Manager F. E. Donohue, for the American Electric Works accompanied Mr. Phillips, who, perhaps for the first time, realized how justly famous has become the Phillips clambake in this part of the country.

The "boiler doctors," Robert F. Carr and Charles S. Kehler, representing the Dearborn Drug and Chemical Works of Chicago, won the hearts of the ladies by the distribution of a souvenir in the shape of a handsome bottle of the well-known Dearborn perfumery. As is well known, the Dearborn company makes a specialty of the analysis of the water of steam boilers, and "prescribes" a remedy for scale. This scientific method of boiler treatment is meeting with a phenomenal success and is especially appreciated by electric-light men. President Edgar sent regrets to his many friends of the Northwestern association.

Proprietor Frank Taylor of the Spalding Hotel, a picture of which is presented herewith, is a genius in his line, and he deserved the handsome recognition of his enterprise that he received from the delegates. Mr. Spalding came all the way to Chicago to go up on the boat and make the acquaintane of the jolly party, and it was unanimously voted that the convention make headquarters at his hotel; it is needless to say that no mistake was made. In fact, henceforth the Spalding will be likely to catch every electrical man that passes through that territory. Mr. Taylor was indefatigable in his efforts to attend to the comforts of everyone that visited his house.

To say that Secretary Mercein was indispensable would be only to repeat an expression that has been current year after year, for the reason that it has been a hard-earned, yet entirely unsought-for, compliment. From the start Mr. Morcein proved himself, as has always been the case, the life of the party. Wherever a strong voice, a well-turned speech or an announcement was required, there was a cry of "Where's Mercein?" At the first evening meeting on the Northwest, at the gathering at Sault Ste. Marie, in the parlor entertainments on the boat, and last, but not least, in all matters of business and comfort, Mr. Mercein was the man of the moment.

Chicago Edison Company.

Stockholders of the Chicago Edison company held their annual meeting on Monday, June 13th, and decided to reduce the number of the company's directors from 13 to 11. This action was suggested by the withdrawal of Col. R. C. Clowry, who resigned last fall, and the request of J. W. Doane that he be relieved of the duties of director, because of the fact that other business required the whole of his attention.

Edward L. Brewster, F. S. Gorton, Samuel Insull, R. T. Lincoln, Joseph Leiter, J. J. Mitchell, Erskine M. Phelps, Byron L. Smith, A. A. Sprague, A. F. Seeberger and Lambert Tree were elected directors for the ensuing year.

Among the statements given to stockholders was an interesting table which shows the growth of the company's business during the last five years by giving the equivalent of 16 candle power lamps connected at the end of each fiscal year:

March 31, 1894	238,124
March 31, 1895	272,410
March 31, 1896	315,732
March 31, 1897	355,140
March 31, 1898	436,083

Victory for Trolley.

The Chicago City Railway company has gained a victory over Montgomery Ward, who attempted to prevent the introduction of a trolley line on Michigan avenue, between Madison and Randolph streets. Last Monday Judge Ball vacated the temporary injunction granted by Judge Brentano. The street-railway company anticipated Judge Ball's decision, and the officials were in readiness to get their cars running by trolley over the disputed territory before any other court could issue another injunction. The block in front of Ward's property was quickly set with poles, and 12 men on a trolley wagon were soon stringing the wires. Superintendent Nagle urged the men to make haste, fearing that at every moment a deputy sheriff would appear and serve an injunction. In exactly 1½ hours from the time the trolley gangs received orders to begin the work Superintendent Nagle gave the signal for the first car to pass over the disputed territory with electric power. The erection of this trolley line completes the downtown loop of the Wabash avenue feeder line. Mayor Harrison granted the railway company permission to erect a temporary trolley loop over these streets during the track-elevation work at Sixteenth and Clark streets.

CORRESPONDENCE.

Northwestern Notations.

Minneapolis, June 13.—Efforts are being made at Brainerd, Minn., to consolidate the street-car, electric-light and telephone systems, and utilize power from a dam to be constructed across the Mississippi River. As things now stand, none of them are profitable investments.

J. C. Hubinger of Keokuk, Ia., has been granted franchises at Quincy, Ill., for a gas and steam-heating plant, an electric-light plant and a street-car system.

L. S. Cass and J. H. Rafferty of the Rapid Transit company, Waterloo, Ia., are interested in a project to build an electric railway from Colesburg to Manchester, Ia. The projected line would be 24 miles long and would run through a prosperous country.

Litchfield, Minn., needs a heavier dynamo for its electric-light plant than it has, as the present one is very much overloaded. Since New Painesville has voted for an electric system, there is talk of selling the present Litchfield dynamo to New Painesville and getting a larger one.

Mr. Gottfried, a Chicago capitalist, is putting in a $15,000 electric-light plant at Elkhart Lake, Wis. The latest and most improved machinery is being used.

The city of Elmo, Ia., will vote June 20th on establishing an electric-light plant.

The Fort Wayne Electric corporation is sounding sentiment at Barron, Wis., with a view to establishing an electric-light plant there.

R. L. Daniel of Moorhead, Minn., has gone to White Sulphur Springs, Mont., to take charge of a 500-light electric plant.

The light committee of the Duluth, Minn., City Council will recommend cutting off 200 lights from the streets, which will mean a saving to the city of $22,000 per annum.

J. W. Petersen, superintendent of the electric-light plant at Fergus Falls, Minn., petitioned the council to increase his salary. He stated that he went in when there were but 500 lights and received $74 a month and $6 for the use of his horse. Now there are 2,700 lights. The council granted the petition.

The street-car company in Des Moines, Ia., is figuring on building a line down Fifth street from an intersection with the Court avenue line, across the new Fifth street bridge, and thence east to an intersection with its South Des Moines and Sebastopol line.

H. E. Chase, superintendent of the electric-light plant of Eldora, Ia., has been appointed to a position with the Hartman Insurance company. The council of Duluth, Minn., has appointed a commission to secure from the Hartman Electric company a price at which it will sell its plant, and also to ascertain the cost of paralleling the plant.

A stock company has been formed at Duluth, Minn., to use the Edison patent electrical ore separator in the states of Minnesota, Wisconsin and Michigan. The magnetic ores of Cook county, which are now valueless, are to be used, and the power is to be developed from the St. Louis River water power.

The council of Winnebago City, Minn., has voted that it is the sense of the council that the village be lighted by electricity. The recorder has been instructed to inspect plants and systems and report.

J. G. Robertson of St. Paul secured the contract at Rochester, Minn., to enlarge the city light plant, for $7,796.

Electric wiring is to be regulated in Des Moines, Ia., in the future. The superintendent of street lights will have that duty added to his other work.

W. D. Meservey of Fort Dodge, Ia., has taken the position as superintendent of the electric-lighting plant at the state penitentiary at Anamosa, Ia.

The Bigelow Electric company was awarded the contract to put in an electric-lighting plant for the city of Neola, Ia., for $5,518.

The electric light plant at Mitchell, S. D., was burned, with a loss of $5,000; it was uninsured. M. B. Cleminger, the owner, will rebuild.

The Ottumwa Electric Railway and Power company's plant at Ottumwa, Ia., was sold by the master in chancery to E. E. McElroy, trustee for the bondholders, for $190,000. The plant is said to be worth $500,000.

C. W. McElyea has passed a deed transferring the street railway of Cedar Falls, Ia., to the Cedar Falls and Normal Railway company for a consideration of $25,000. A mortgage for $10,000 was executed to J. A. Fitchpatrick.

The Chippewa Valley Electric Railroad company has been formed at Eau Claire, Wis., with $200,000 capital stock. It will build an interurban line to Chippewa Falls, for which the survey has been completed, and will eventually own and operate the lines of Chippewa Falls and Eau Claire. C.

PERSONAL.

Cyrus O. Baker, Jr., master of transportation, was elected an honorary member of the National Electric Light association at the Chicago convention.

Charles W. MacCord, Jr., the younger son of Professor MacCord of Stevens Institute of Technology, who died at Auburn, N. Y., from appendicitis, was buried last week at Hoboken. Mr. MacCord was in his twenty-sixth year. He was graduated as a mechanical engineer from Stevens Institute in 1894, and became a contributor to engineering magazines, and much that he wrote attracted attention, particularly a treatise on slide valves, which was published last year. Since last June he had held a responsible place with the firm of McIntosh, Seymour & Co., engine builders, of Auburn, N. Y.

ELECTRIC RAILWAYS.

The Walker company received a telegram from its patent attorneys in New York city on June 11th, announcing that "Judge Shipman has just decided foundation reversible trolley patent in our favor. Bill dismissed with costs."

Workmen are engaged in stringing the cable for the Lima and Honeoye Falls electric railway in New York, and it is expected that in a comparatively short time the electric-railway and lighting systems for the villages mentioned will be in full operation, as the power house is nearly ready for the machinery.

As the outcome of the action brought against the Lock City Electric Railway company by the Mercantile Trust company of New York, to foreclose on $650,000 worth of bonds, which has been sold at the courthouse in Lockport to Frank Haviland of that city for $10,000. Included in the sale are the franchise, rolling stock, poles, wire and cars.

TELEGRAPH.

The Western Union Telegraph company announces that the laying of the new cable between Fort Townsend, Wash., and Victoria, British Columbia, has been completed and that direct telegraphic communication can now be had with Victoria.

Cecil Rhodes recently addressed the African Transcontinental Telegraph company upon the subject of the "Cape to Cairo" telegraph, and expressed his confidence in the "thoroughly practical character of what has been described as a 'imaginative' scheme." He was certain that the line would get through to Cairo, and then, he said, the company would send cable messages from Africa to London. Mr. Rhodes' plans were unanimously indorsed, and the company's capital was largely increased.

POWER TRANSMISSION.

The Niagara Falls Power company is preparing to transmit power to Lockport, a city of 16,000 inhabitants, about 19 miles from Niagara Falls. It is probable that the transmission line will follow the route of the Buffalo and Lockport canal from Tonawanda to the Lock City. If a sufficient number of patrons can be secured, Lockport will enjoy the advantage of Niagara power before next winter. The city has a number of busy mills, the majority of which have been much hampered by the lack of a power supply, as the main source of power has been water from the Erie Canal, a state possession, that is in no way reliable for many months in the year.

The Urban Roller Mills of Buffalo will be operated by electric power transmitted from Niagara Falls. It is expected that the new source of power will be utilized before the end of July. The main motor of the plant will be of 400 horse power, direct connection being made to the present system of shafting, which will be, for the most part, retained. The big motor will run all the machinery of the mill except the machinery of the grain elevator and the machinery in the mill connected therewith. In these latter instances two separate motors will be installed in order to save the long line of shafting required, with its consequent friction and loss of power. The total amount of electrical power to be used in the mill will be very close to 500 horse power. It was expected to have installed the electrical machinery and apparatus long before this, but the demands of the government on the manufacturers of electrical apparatus have caused some little delay.

TECHNICAL SCHOOLS.

The 28th annual commencement exercises of the Worcester Polytechnic Institute will be held on June 19th to 23d. The programme includes a meeting of the Washburn Engineering society in the hall of the engineering laboratory on June 21st, at 8 p. m., and an address by the Hon. H. S. Pritchett, superintendent of the United States Coast and Geodetic Survey, Washington, on "The Engineering Side of Astronomy," on June 23d. The alumni dinner in the engineering laboratory will be held in the evening of the same day.

ELECTRICAL SECURITIES.

The Columbus Street Railroad company reports gross earnings for May of $63,346, an increase of $14,456 as compared with the same month of last year, and net $33,728, an increase of $7,922. For the five months ended May 31st the gross earnings were $297,887, an increase of $86,205 as compared with the corresponding period of last year, and net $138,501, an increase of $18,494.

Directors of the West Side Construction company of Chicago have declared a dividend of 70 per cent., payable on June 27th to stockholders of record of June 20th. The dividend is equal to seven per cent. on the original capital stock of the company, which on March 28th was reduced from $5,363,900 to $536,390. This was done, according to the resolution adopted, in view of the facts that the contract between the company and the Metropolitan "L" road had been completed, and that, the liquidation of the affairs of the company and the distribution of its assets among its shareholders having reached a point where the nominal value of its capital stock was very largely in excess of the value of its remaining assets, the company was thereby subjected to the payment of taxes greatly in excess of those which it fairly and justly should pay. The funds with which to make the $7 per share distribution were acquired a few days ago through the sale by the construction company of its holdings of Union Consolidated Elevated bonds, amounting to $407,000 par value. If the company got par for its bonds, the proceeds of the sale amounted to $70 per share on the outstanding stock. As assets the construction company still owns the Franklin and Market streets real estate, formerly the downtown terminal of the Metropolitan "L," which is valued at $270,000, and the indebtedness of the Metropolitan "L" company in the form of two notes and some past due coupons.

The Chicago Metropolitan Elevated reorganization committee is now at work on a plan for rehabilitating the property, which, it is thought, will be ready for announcement some time in August. The committee has gained what it considers a fairly accurate idea of the earning capacity of the road. It has now been eight months since the opening of the loop. From the records obtained in this period it is estimated that the road is able to earn approximately $450,000 a year net. This exceeds interest requirement on $10,000,000 of four per cent. bonds. At the same time there is a fair margin for increase in traffic and a chance of reducing the operating expenses to an average of 45 per cent. of gross. The plan now being discussed by the reorganization committee contemplates briefly the issue of either $10,000,000 per cent. bonds or $7,500,000 five per cent. bonds. These will be exchanged for the bonds now outstanding at the rate of $667 in new four per cents. or $500 in new five per cents., as may be determined, for each $1,000 principal of the present issue. For the balance of face and accrued interest of old bonds and for assessment on stock, preferred stock or income bonds will be given. The Metropolitan company has outstanding $15,000,000 of five per cent. first-mortgage bonds and $15,000,000 of common stock. Its floating debt is about $800,000, being owed to the West Side Construction company. The stock, in all probability will be assessed between $6 and $8 a share in order to liquidate this indebtedness.

MISCELLANEOUS.

In 1899 the centenary of Volta's discovery of the electric pile is to be celebrated in Como, his native town, by an international exhibition of electrical appliances.

An acetylene-gas explosion occurred at the residence of Dr. Charles Beaver of Mancelona, Mich., a few days ago. The explosion happened while the doctor was engaged in cleaning the generator, and he was severely burned about the face. The damage to the room was slight, as the quantity of gas contained in the generator was very small at the time.

TRADE NEWS.

The Peru Electrical Manufacturing company is sending its patrons souvenir pin-holders of porcelain bearing the company's monogram. It is very neatly gotten up and should prove a useful reminder.

Huebel & Manger are having quite a run on their well-known style "F" skeleton bell. This is used for important signal work on railroads, vessels, etc., and for fire alarms in hotels, schools and factories, and for all purposes where a reliable, loud-ringing bell is required.

The Warren-Medbery company of Sandy Hill, N. Y., is now manufacturing a full line of Medbery switches and switchboards in all sizes, and will shortly be able to supply the market with the celebrated "Medbery insulation" for electric railways, which is so widely and favorably known.

Many of the convention visitors called at the new station of the Chicago City Railway company, which is designed for fifteen Sprague-Sidowatt Walker rope driven generators. The Walker company is now supplying the Brooklyn electric railway with 300 motors of 80 horse power each, and is making a specialty of large motors for heavy interurban traffic.

The Chicago office of the Stilwell Bierce and Smith Vaile company has been removed to 311 Dearborn street. The company is showing a complete line of electric pumps and is meeting with considerable success in selling them. Electrically driven outfits have been supplied to the Apple River Power company of New Richmond, Wis., the

Matthiessen-Hegler Zinc company of La Salle, Ill., and the Choctaw Railway company.

The new power house now being erected by the Port Chester Street Railway company of Port Chester, N. Y., is 45 feet by 84 feet, and consists of a boiler room, engine and dynamo room. The building has brick side walls in which are built steel columns supporting steel truss roof. In the engine room is a traveling crane, arranged so that any part of the engines or dynamos on the floor below can be readily lifted and moved from one place to another. The power house is built in a substantial manner, and is a well-designed modern station in every respect. The steel work for this building was designed and is being erected by the Berlin Iron Bridge company of East Berlin, Conn.

BUSINESS.

The Central Manufacturing company of Chattanooga, Tenn., furnished all the special pins used in the installation of the Lachine Rapids Hydraulic and Land company of Montreal. This plant, which has become well known through the many interesting and unusual features connected with it, was described by Mr. Walbank before the National Electric Light association last week.

Eugene Munsell & Co. and the Mica Insulator company of New York and Chicago were represented at the National Electric Light convention, Chicago, by Charles E. Coleman, manager of the two concerns in the West. The companies' blotters were distributed freely at the writing-rooms and headquarters of the different companies represented at the Auditorium during the convention.

J. Holt Gates & Co., representing the Walker company of Cleveland, the Wagner Electric Manufacturing company of St. Louis and the Card Electric company of Mansfield, O., report the sale last month of 1,900 kilowatts of generators, besides numerous switchboards, street-railway equipment and other electrical details. The Walker, Wagner and Card companies have never before been so busy in their history as at the present time, as they are working their forces day and night.

The Ferracute Machine company of Bridgeton, N. J., manufacturer of presses, dies and other machinery for sheet metal, has for some years been paying special attention to presses and dies for making armature disks and other electrical work, and it has been successful in introducing its machines into the largest factories. The General Electric company has from time to time put in the Ferracute company's large double-crank presses for cutting large disks, and it has now what is probably the finest row of presses of this kind, perhaps, in the world—13 of these presses in a straight line, all running on armature disks and for various other sheet-metal work. The Ferracute company has also placed a number of the large double-crank presses in the works of the Westinghouse Electric company, Walker Manufacturing company, Crocker-Wheeler company, C. & C. company, etc. It has also sent a number of these presses abroad to Germany, England, France and Belgium. This company has also a line of open-front presses for smaller armature disks, a line of punching presses for instrument work and other goods in heavy metals, and a line of double-action or drawing presses for balls, cups, shells, lamp parts, etc. It is just placing on the market a new machine for indexing and notching armature disks, which is adjustable for various sizes of work and for any number of notches, and embodies a number of improvements not found in any other machines now on the market.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued June 7, 1898

605,067. Electric Switch. Charles C. Badeau, Schenectady, N. Y. Application filed September 17, 1897.

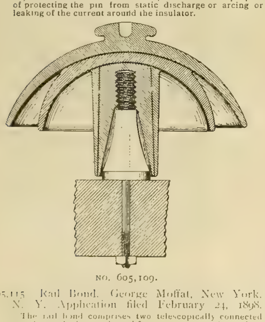
The first claim is given: In an electric switch, the combination of a switchboard, stationary switch members secured to said board, a pivoted switch blade co-operating with said switch members and made from a strip of metal bent lengthwise upon itself, and of substantially uniform width throughout, and a handle secured to the switch blade at the bend.

605,090. Electrical Apparatus for Charging Furnaces. Joseph P. Eck, Muncie, Ind. Application filed August 12, 1897.

This apparatus consists of a charger track adapted to travel across the face of the furnace, a charger frame adapted to run upon the track, a charger bar pivotally suspended within the frame, a rod rotatable in the charging bar, a cam adapted to enter the wall of the charging bar and engage the shank of the pan, means for raising and lowering the outer end of the charger bar, and suitable electric motors in proper circuit for operating the various parts of the apparatus.

605,109. Insulator. Fred M. Locke, Victor, N. Y. Application filed April 23, 1898.

An insulator made of porcelain is constructed of two or more parts fitted one into the other, and secured together, the inner part being provided with a socket by which it is mounted, the inner part or shell extending down to a point adjacent to the cross-arm, forming a sleeve for the purpose of protecting the pin from static discharge or arcing or leaking of the current around the insulator.



NO. 605,109.

605,115. Rail Bond. George Moffat, New York, N. Y. Application filed February 24, 1898.

The rail bond comprises two telescopically connected members, which are adapted for engagement with openings in adjacent rail sections.

605,174. Induction Coil. Adrian L. Bogart, Jamaica, N. Y. Application filed April 22, 1897.

An interrupter is employed having an armature mounted upon a relatively light spring, a second and heavier spring carrying a movable contact point and arranged in the path of movement of the first spring, and a fixed contact point normally making contact with the movable contact point.

605,197. Electrical Valve-controlling Device. Arthur E. Colgate, New York, N. Y. Application filed May 2[illegible], 1896. Renewed April 1, 1898.

An automatic circuit controller for periodically opening and closing the circuit is provided with a magnet for cutting the automatic controller out of circuit and a single hand-operated switch for controlling the operation of the valve at will and also for controlling the operation of the last named magnet to connect or disconnect the automatic controller in circuit.

605,[illegible]. Electric Transformer. John J. Bellman and Charles [illegible] Rittenhouse, New York, N. Y. Application filed June [illegible], 189[illegible].

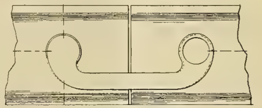
The ferro-magnetic [illegible] of integral plates so mortised that when the [illegible] properly assembled the core of the magnetic field will be approximately circular in cross-section.

605,211. Trolley Switch. Jacob H. Vanasdel[illegible], Seattle, Wash. Application filed October [illegible], 1897.

A suitably supported switch plate is provided with a keeper, a guide is arranged at the under side of the plate, a movable, spring-pressed switch point is arranged at the under side of the switch plate and normally bearing against the guide, and a latch is also arranged at the under side of the plate and connected with the switch point and adapted to engage the keeper and hold the switch point away from the guide.

605,228. Electric Arc Lamp. William Hochhausen, Brooklyn, N. Y. Application filed January 22, 1897.

There is the casing containing the operating mechanism in combination with a vertical partition dividing the space inclosed by the casing into two chambers, one of them containing the mechanism to which access must be had in trimming, and means for gaining ready access to the chamber from the exterior without opening into the other chamber.



NO. 605,115.

605,251. Trolley-wire Hanger. George E. Johnson, Los Angeles, Cal. Application filed August 19, 1896. Renewed July 22, 1897.

Features of this device include an interiorly screw-threaded cap, a plug of insulating material exteriorly screw-threaded and screwed into the cap, a trolley wire hanger having its stud secured in the plug, the rim of the cap being beveled outward and downward away from the plug to form a drip edge.

605,256. Insulator. Ralph D. Mershon, Colorado Springs, Colo. Application filed February 14, 1898.

An insulator for high-tension circuits having a long, tubular petticoat adjacent to the supporting pin and a short outer petticoat of much greater diameter, the edge of which is approximately the same striking distance from the cross-arm and the supporting pin.

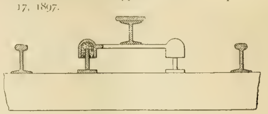
605,260. Mounting for Third Rails. Sidney H. Short, Cleveland, Ohio. Application filed November 5, 1897.

A supporting bar for a third or contact rail having inverted bell or cup-shaped castings arranged to project from the ends and on the same side thereof, insulating material arranged in the castings, and supporting standards arranged to be received in the insulating material.

605,261. Third Rail for Electric Railways. Sidney H. Short, Cleveland, Ohio. Application filed November 5, 1897.

A bar is supported by, but insulated from, the standards, a third or contact rail is supported upon the bar, the rail presenting a side surface for contact with the shoe or collector, and a strip or plate laid lengthwise upon the rail and extending over the top edges thereof.

605,279. Safety Lock for Incandescent Lamps. Ernst Faller and Herrmann Herbstritt, San Francisco, Cal. Application filed September 17, 1897.



NO. 605,261.

In an incandescent light, a globe having a metallic screw-threaded end or base, the permanent fixture having the corresponding screw-threaded portion into which the globe portion is adapted to interlock, a shoulder or catch formed upon the entering interlocking portion, and an elastic automatically engaging tongue projecting inwardly from the other portion of the fixture so that it can only be reached from the interior of the end or base whereby the two are engaged and permanently locked when the globe is in position for operation.

605,294. Telephone Holder. Jehiel T. Moore, Minneapolis, Minn. Application filed August 24, 1897.

The pivotally supported lever has a balance weight on one end and a telephone receiver clasp on the other end, with a telephone switch operating connection.

605,304. Controller. Thorsten von Zweigbergk, Cleveland, Ohio. Application filed February 23, 1898.

In a controller there is the combination with the controller shaft of a collar tightly surrounding the shaft and a trough below the collar and adapted to receive water passing from it and convey it beyond the controller.

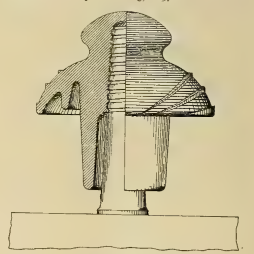
605,317. Electric-railway System. William Lawrence, New York, N. Y. Application filed December 1, 1897.

A junction box for surface contact railways is provided with a seat at one side for the surface contact, a cover plate alongside thereof, and having a removable secondary switch box within the junction box, a shaft within the secondary switch box carrying a switch, and extending out across the junction box and carrying an armature.

605,326. Trolley Connection for Electric Cars. John G. McLaughlin, Brooklyn, N. Y. Application filed December 28, 1897.

The first claim is for the combination of the trolley pole, the swinging frame having cheeks extending upward above and beyond the extremity of the trolley pole, and the wheel mounted between the upwardly projecting cheeks of the swinging frame.

605,341. Telephone System. Robert T. Reid and James L. McDonnell, Tacoma, Wash. Application filed September 25, 1897.



NO. 605,256.

This arrangement includes the combination with the conductors of a party line, a series of telephones arranged in parallel between the conductors, a switch arm for each multiple arc telephone circuit, an electromagnet, a polarized armature for the magnet, an arm on the armature normally disposed under one end of the switch arm and a circuit in parallel with the telephone circuit and including the electromagnet, the arm on the armature thereof and the switch arm.

605,345. Call-box System. Edgar E. Salisbury and Albert E. Dean, Tacoma, Wash. Application filed June 22, 1897.

A messenger call system is described, comprising main wires, a battery in the main wires for operating all the call boxes, an ordinary call-box circuit, normally closed contact figures arranged in circuit, an auxiliary circuit comprising a resistance and transmitter, and means for connecting the auxiliary circuit with the main-line wires.

605,358. Signal Device. Frank B. Taylor, Edgar E. Salisbury and Albert E. Dean, Tacoma, Wash. Application filed July 23, 1897.

A controlling device for an electric circuit is employed, comprising a wheel having a number of stop pins, an armature lever adapted to engage with the respective stop pins, an electromagnet located in a main circuit and co-acting with the armature lever, a local circuit in which the armature lever is comprised and for which it serves as a circuit-closer, and a motor in the local circuit for operating the wheel.

605,424. Connector for Storage-battery Plates. Gilbert Hart, Detroit, Mich. Application filed January 13, 1898.

An insulating base bar is employed, together with a lead or metallic plate superimposed upon the base bar, connector plates alternately extending in opposite directions and resting at one end upon the lead or metallic plate, and screws passing through the connector plates and the superimposed lead or metallic plate into the insulating base bar.

Western Electrician.

Vol. XXII. CHICAGO, JUNE 25, 1898. No. 26

Enlarging the Power Plants of Niagara.

By Orrin E. Dunlap.

The first turbine and generator installed in the extension of the Niagara Falls Hydraulic Power and Manufacturing company's power station are now in operation. The turbine is the first of five which are to have place in the new building. It was built by R. D. Wood & Co. of Philadelphia, and in general appearance resembles somewhat the turbines installed in the original section of the station. It has a capacity of 2,500 horse power, and it has been given position over the last of the five valves of the penstock that is nearest the outside wall of the power station. The wheel is of the Jonval- a pair of 24-inch I-beams. The weight of the bronze wheels is 5,095 pounds. They are located in the draft tubes, one on each side of the casing proper, on horizontal axis, and directly connected to the generator. This shaft is supported by a rigid bearing. The disk that forms part of the flush bearings is keyed to the shaft and adjusted by four heavy set-screws, one on each side of the shaft, to take up the thrust. The wheels discharge laterally into the discharge or receiving pipes. The casing is stiffened by four 2¾-inch rods, which extend through it. In designing this turbine special provision was made for the great pressure on the component parts, and especially on the gates, which were planned on a slide-motion principle and counterbalanced, this been installed, the other being in course of construction. The generator now in place will supply current for the operation of the new plant of the National Electrolytic company in the manufacture of chlorate of potash, and was made by the General Electric company. The machine has 14 poles and will make 250 revolutions per minute. Its output is about 5,000 amperes at 175 volts, or a capacity of 875 kilowatts, nearly 1,200 horse power. It is of large type, and direct-connected to the turbine. In its construction consideration was shown for the fact that it would be called upon to do the severe work of the electrolytic process, which requires practically a continuous service. The National Electrolytic company's plant is located on the high bank

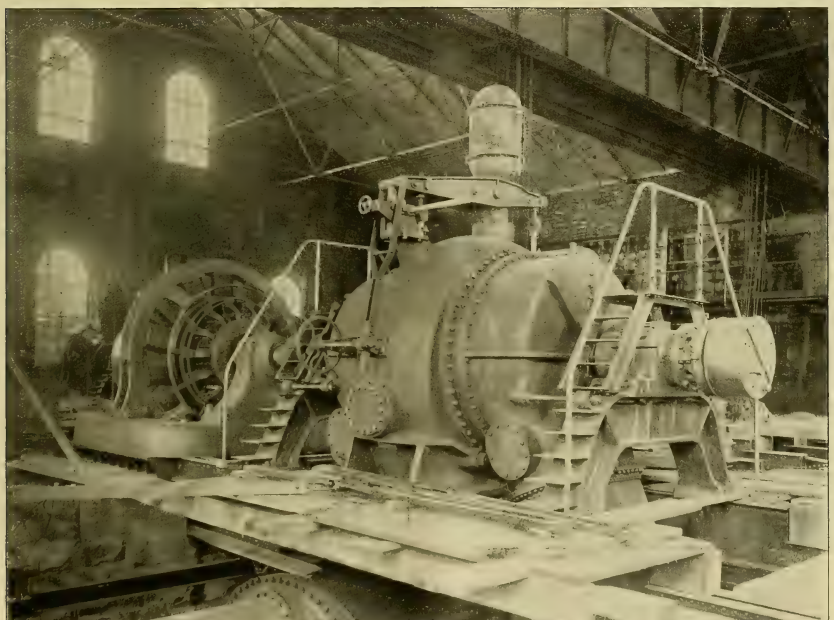

FIG. 1. ENLARGING THE POWER PLANTS OF NIAGARA.—DIRECT-CONNECTED TURBINE AND GENERATOR.

Geyelin improved type, and in construction closely resembles the six wheels made by the same firm for the Niagara Falls Paper company. However, the head under which the wheels are operated has made some slight changes necessary. The head at the paper mill is only 140 feet as against 210 feet in the power house of the Niagara Falls Hydraulic Power and Manufacturing company. The turbine has a large circular casing in which the wheels proper are located. The water is admitted underneath and flows upward to the guide wheels through a gate and then to the runners. From the sides of the casing discharge pipes project laterally and then downwardly, draft tubes 22 feet eight inches long being attached, thus utilizing, in part, the atmospheric pressure. The heads of the large casings are more oval and not quite so high as the casings about the wheels in the first section of the power house. They are made of cast iron 1⅞ inches thick and have heavy 2½ by six-inch ribs at the bottom. The weight of the casing is about 10 tons, while the total weight of the wheel is about 21 tons. It stands upon ing a simple but effective method of overcoming the enormous pressure which would act on each individual turbine gate. The gate is of the ring pattern, is operated by a walking beam, which works over the top of the casing proper, and is connected to the beam by steel gate rods 2½ inches in diameter, which extend down through glands into the casing. Cast-steel brackets are riveted to the gate, and to these the gate rods are connected. The runner has 34 buckets, with a total area of 140.25 square inches, while the guide wheel has 29 buckets and a total area of 140.53 square inches. Over the walking beam there arises an air cylinder about 30 inches high and having an inside diameter of 20½ inches. On this turbine provision has been made for disconnecting the governor by simply operating a wheel, which unscrews a rack. The Reynolds governor is attached. The turbine was installed under the supervision of E. H. Broome, the Niagara Falls representative of the makers.

While it is intended that this turbine shall operate two generators, only one of them has so far above, adjoining the Cliff Paper company's mill. It is a story-and-a-half brick building, with basement. The success met with in transmitting current from the original installation to the lower works of the Pittsburg Reduction company over aluminum cables has led the Niagara Falls Hydraulic Power and Manufacturing company to install aluminum cables to carry current from the new generator to the National Electrolytic company's factory. The lower portion of these conductors will be in bar form, while the upper part will be made after the manner of well-insulated copper cables. This will be the first conductor of the kind placed in service.

The second generator to be attached to this turbine will be the largest machine in the station. It will form a part of the equipment of the Buffalo and Niagara Falls Electric Light and Power company, and when it is in operation it will allow of the removal of the machines of the company, now located in the basement of the Cliff paper mill, to the lighting station on Fourteenth street. The Buffalo and Niagara Falls Electric Light and Power company

is a patron of both power companies at the Falls. The new generator is being made by the Walker company of Cleveland, O. It will be an alternating-current dynamo of 700 kilowatts output capacity, at 2,200 volts pressure, 125 cycles per second, when operated at 250 revolutions per minute. The contract calls for the installation of a continuous-current exciter of sufficient capacity to supply current to the fields of the dynamo to permit of its producing 1,100 kilowatts at its standard voltage, should such be required for a short time. The switchboard to be installed with this machine will be of blue Vermont marble, furnished with all necessary instruments and appliances. The manager of this company is Frank G. Lott, who is also electrical superintendent of the Niagara Falls Hydraulic Power and Manufacturing company.

The penstock which furnishes the water for the new installation is said to be the largest ever erected. It is a little over 11 feet in diameter, and was made by Struthers, Wells & Co. of Warren, Pa. The steel of which it is made varies from five-sixteenths to 1⅛ inches in thickness. It leaves the forebay in an elliptical bell-mouth about 20 by 11 feet in size. For a distance of 60 feet it extends out horizontally, be about the same style as those in the original installation, a slight improvement having been made by Chief Engineer Johnson to provide for the removal of slush ice. A series of racks screens the water before it is allowed to pass into the penstock, thus removing all floating substances likely to injure the wheels. The forebay has been extended in the rear of the lower works of the Pittsburg Reduction company, and the walls were built of concrete. A second canal to connect the forebay with the canal basin is in course of construction, and will run along the south side of the aluminum plant. The walls are also built of concrete. It is expected that enough water will flow from the canal basin to the forebay through the first connecting canal to supply the turbines now in operation, but as more turbines are installed, a larger water supply will have to be provided. The present dimensions of the power house are 100 by 120 feet, and there is ample room on the south side of the building for another addition the same size as that just finished. Access to the power house is now had by way of the elevator in the Cliff paper mill.

In the accompanying illustrations will be found interesting views of the machinery employed and the progress made in the improvements. Fig. 1 shows the new 2,500 horse power turbine and connected generator, Fig. 2 the new penstock and Fig. 3 graphically illustrates the placing of the penstock in the tailrace. The lower end of the penstock is shown in Fig. 4 and the frame of the new gate house over the forebay in Fig. 5. This picture also shows the concrete walls of the new canal. The interesting process of lowering an armature over the Niagara cliff is photographically reproduced in Fig. 6. The general view presented in Fig. 7, showing the addition to the power house in the gorge, penstock, etc., gives an excellent idea of the location and surroundings. The section of the building with the ventilator on the roof is the new part. The work is attracting much attention among engineers throughout the country.

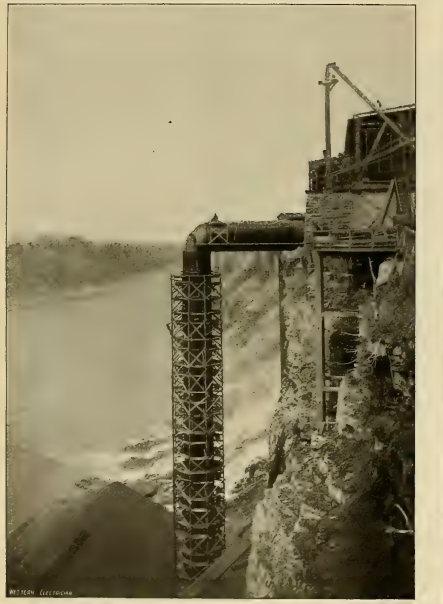

Fig 2 New Penstock.

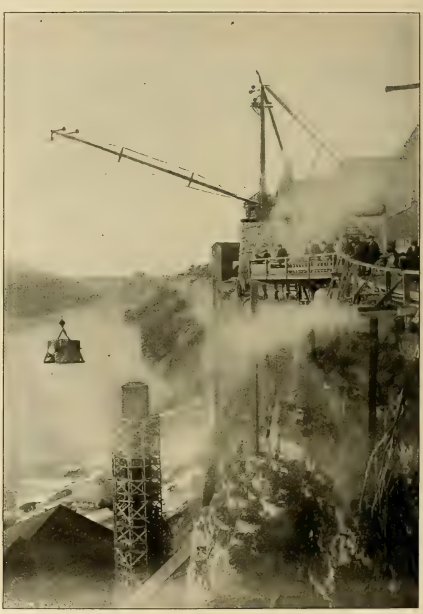

Fig 6. Lowering an Armature over Niagara Cliff.

ENLARGING THE POWER PLANTS OF NIAGARA.

supported on two huge iron girders. Then it drops vertically 200 feet to the power house at the waters edge in the gorge. As will be seen by the illustration, it stands out from the cliff in column-form, while the old penstock hugs the cliff in its descent to the station. The new method of erection is an idea of Wallace C. Johnson, who is chief engineer of the Niagara Falls Hydraulic Power and Manufacturing company as well as president of the Engineers' Society of Western New York. All the work of the company is done under the supervision of Mr. Johnson, and he has made several notable improvements in the new installation, as compared with the old. As the penstock passes under the power-house floor it enters the tailrace, in which it is supported on a series of posts and beams, all made adjustable by a series of keys, the work of the Variety Iron Works of Cleveland, O. For a distance of 50 feet under the floor the penstock has a diameter of 13 feet. It then reduces until it is about seven feet, finally tapering to one 18 inches in diameter and ending in an air chamber 15 feet high and four feet in diameter. Along its course there are five 60 inch valves for supplying water to turbines. The tailrace of the new section of the plant is a little larger than the first tailrace, and is most substantially built.

The gate house over the forebay is of steel frame, covered with corrugated iron. The gates used will

---

The West Kootenay Power and Light company is rapidly completing its power plant at Bennington Falls. The poles are set and two wires are stretched between the Falls and Rossland, a distance of 31 miles. The line goes into Rossland over the Montezuma Mountain, and it is the intention of the company to erect another circuit, so that in case of accident there will be no interruption of the current. The first cost of the plant is placed at $125,000, but it is said that the expenditure upon it may be extended to $500,000.

Analysis of the Cost of the Generation and Distribution of a Unit of Electricity.[1]

By Calvin W. Rice

The speaker has been asked at short notice to give this paper, which, considering the nature of the question, should have several months' labor for its preparation. Consequently no original work could be attempted.

I am fully aware of the responsibility of undertaking such a discussion, and therefore will confine the paper to a resume of the most reliable data which can be secured from literature by recognized authorities during the last few years.

It is the intent of the paper to show what has been done, what is being done, and what is therefore possible, rather than to give theoretical tables. It is the intent also to show the advantage of watching each one of the various items which go to make up the total cost, and, by pointing out the proportions of each to the whole, to aid one in the discovery as to which particular items are disproportionately large in his plant.

Before taking up the consideration of the cost of operation of a plant we should first consider the plant itself.

Total Investment Per Kilowatt.

In America the variation in the investment per kilowatt is $200 to $750 per kilowatt capacity installed. In a few cases the figure is below $200, and in a few as high as $1,000; but in the great majority of cases the cost is below $400.

In this respect American practice is ahead of that of Great Britain and the continent, where the majority of plants have a total investment of over $500 per kilowatt installed.

Later in this paper are given figures on some railway plants in Chicago costing less than $75 per kilowatt. I think these figures refer to stations alone, whereas the corresponding values for lighting plants include distributing systems also.

The importance of keeping down the investment per kilowatt need not be emphasized.

The principal items that go to make up the total investment are real estate, steam or water power plant, electric plant, distributing system and minor details.

In the first item we naturally find a great variation in the different plants. In country towns it runs as low as $25 per kilowatt, and in cities as high as $150

1. Read before the National Electric Light association, at Chicago, June 7, 1898.

and over. In other words, there are some plants where the investment in real estate alone is greater per kilowatt than the entire investment is in others.

The investment in steam plant varies from $20 to $60, with figures on the electric plant slightly greater.

It is needless to say that the location of the plant ought to be considered with reference to all influences, each considered separately and reduced to a common method of comparison, that is, the dollars and cents value per year of each consideration.

For instance, in a large city which I visited a couple of weeks ago I observed a new station being erected not over 1,000 feet from a river, yet five or six 1,000 horse power, non-condensing engines were being installed. It is reasonable to assume that the convenience of that site to the main street of the city had a greater dollars and cents value than the consideration of condensing plus the difference in value of the land, as the company had the option to sell the present power site to the government and to buy a river site for less money.

In buying the steam and electric plant, however, it is essential to consider reliability above every other consideration. In emphasizing this point, to make it the end sought while considering the merits of boilers, engines, water-wheels or generators, it should be viewed in its broadest sense. It is of assistance in examining bids on electrical aparatus or engines, to compare the prices per pound, and weight in pounds per kilowatt or horse power, and in considering boilers, heating surface and pounds per horse power, as well as price per pound.

The various methods of rating aparatus and of stating ability to stand overloads are very confusing to the purchaser, and comparison by pounds develops features not otherwise noticed, but worth considering carefully.

Having decided whether or not it is economical

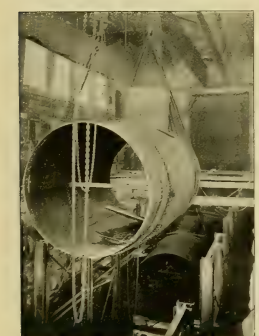

FIG. 3 ENLARGING THE POWER PLANTS OF NIAGARA.—PLACING PENSTOCK IN TAIL RACE.

to use simple, compound or condensing engines, decision as to the boiler pressure will follow as a matter of necessity, and will in turn decide in part whether return tubular or water-tube boilers will be advisable. The price per horse power of boilers is now not widely different.

The advantage of direct connecting over belt or rope drive is now recognized, so very little need be said. The amount of saving has been very carefully sought by Mr. Crompton, and in 23 of the largest English works the results have been tabulated, showing that the cost of fuel averages 46 per cent. higher where the dynamos are rope-driven than where the dynamos are direct-driven by high-speed engines.

Great stress is nowadays put upon high efficiency, and, while this is important, reliability should be the principal feature.

In the present day of good design there is at best little to be gained in absolute efficiency but the cost of energy, and the popularity of electric light and power will be very much affected, according as it is reliable.

Good regulation in the station is more important than high efficiency. Good regulation in the station means ability to use high-efficiency lamps.

The use of 50-watt instead of 58-watt lamps means a saving of 14 per cent. directly in the lamps and in the copper losses. Relatively this increase in efficiency is much greater than is possible in any of the various types of boilers, engines or generators. Therefore the governing of the engine from no load to full load, and the regulation of the generators with load thrown off and on, should be carefully determined.

The value of accessories in the reliability of the plant and the reduction of labor and attendance is important. These accessories are as follows:

I. Feed-water appliances:
(a) Injectors.
(b) Steam pumps.
(c) Electric pumps.

II. Boiler appliances (steam or electric):
(a) Forced draught.
(b) Mechanical stokers.
(c) Super-heaters.
(d) Coal handling and storage.
(e) Ash conveyors.

III. Cranes:
Mechanical or electrical.

IV. Auxiliary electric apparatus:
(a) Boosters.
(b) Station motors.

It is not advisable to drive the exciters from a motor taking current from the main generators, on account of fluctuations being multiplied, but under

FIG. 5. ENLARGING THE POWER PLANTS OF NIAGARA.—GATE HOUSE OVER FOREBOY.

certain conditions the feed pumps, coal and ash handlers, overhead cranes and stokers may be driven with success and economy by either alternating or direct-current electric motors.

Electricity as delivered at the switchboards is generated with economy and can be used more advantageously than steam. The inefficiency of steam is illustrated in the following table, showing the indicated horse power and steam per indicated horse power of some of the auxiliary apparatus of the U. S. S. Minneapolis.

Name of Auxiliary.	I.H.P.	Steam per I.H.P.
Pump of starboard condenser	1.23	266
Circulating-pump engine	19	55
Starboard air pump	6.5	183
Center air pump	25	78
Vertical duplex fire pump	1	205
Horizontal duplex fire pump	0.8	319
Same pump	0.4	150
Vertical duplex bilge pump	2.5	171
Fireroom feed pump	8.8	91
Same pump	1.6	243
Forced-draft blower engine	16.	77
Single-cylinder horizontal flushing pump.	1.4	194
An ice machine	6	70

DISTRIBUTION SYSTEM.

From the station let us go to the cost of the distributing system, which is now becoming an enormous item of expense, since underground conduits are required in many places. The cost of underground construction complete is about four times that of overhead construction.

In the choice of duct and insulation on conductors, again let me emphasize the importance of reliability. With such an enormous investment it is almost out of the question to consider material liable to break down.

In the tests which should be required of the cable two important features should be made prominent. First, the testing apparatus should be at least 50-kilowatt capacity. The seven and eight-kilowatt testing transformers, which up to within a few years were considered sufficient, were a delusion. When it is stated that a cable must stand a test pressure it should be required that that test pressure be maintained at least one hour, as the momentary test is not sufficient to develop faults. Make the insulation-resistence requirements moderate, but insist that the test pressure from a large transformer be maintained

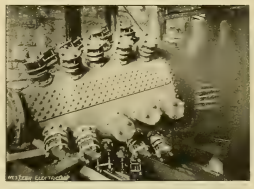

FIG. 4. ENLARGING THE POWER PLANTS OF NIAGARA.—LOWER END OF PENSTOCK.

one hour. In the matter of joints employ only the most skilled labor.

PLANT MANAGEMENT.

Total cost or price.	Generation and Distribution	(a) Material	(1) Fuel (2) Water (3) Supplies
		(b) Labor.	(4) Wages (5) Superintendence
	II. Maintenance		(6) Material (7) Wages (8) Superintendence
	III Management		(9) Directors (10) Salaries (11) Expenses
	IV. Profit		(12) Per cent. on capital.

The cost per unit in what follows refers to 1,000 watts maintained one hour.

The price charged per unit is made up of cost and profit.

The cost may be subdivided as to

I. Generation and distribution; II. Maintenance; and III., Management.

I. Generation and distribution may be divided into

FIG. 7. ENLARGING THE POWER PLANTS OF NIAGARA.—VIEW OF POWER HOUSE IN GORGE.

The use of an oil-distributing system reduces the amount of oil consumed and the attendance required. The air-blast for cleaning around the generators is a great assistance; it saves time, labor, and acts as an insurances against burn-out. This apparatus can now be bought in a combined form, so that the same air compressor and tanks furnish air for the oil circulation and for cleaning.

(a) material and (b) labor; (a) representing (1) fuel, (2) water and (3) supplies; (b) representing (3) wages and (4) superintendence.

II. Maintenance is made of (5) material, (6) wages and (7) superintendence.

III. Management may be subdivided as to (9) directors, (10) salaries and (11) expenses.

As we compared total cost of plant per kilowatt

and found it on the average to be under $400, calculations as to cost of operation of plant per unit output per year give that figure to be, on the average, under 50 cents. That is, on the average, it requires 50 cents' worth of plant to generate and distribute one kilowatt-hour per year.

Load Factor

This immediately develops an important point, namely, load-factor. This feature has been brought out with advantage by Mr. Hammond from data of the English companies. Such data are not obtainable in America, so I quote from Mr. Hammond's paper:

"Former writers have not failed to dwell upon the marked effect which the load-factor has upon the costs of production, and in my estimation of the influences which bear upon that problem I place load-factor directly after output. Without the latter the most favorable load-factor is useless, but, combined with a healthy output, a favorable load-factor greatly reduces costs.

"So convinced is Mr. Arthur Wright of the importance of load-factor that he offers to supply all his customers at three cents per unit for any consumption beyond an average of one hour per day of their maximum demand throughout the year.

"I use 'load-factor' in the sense of the ratio of the actual units generated to the product of the maximum of the year and the total hours of the year; the 'load-factor,' therefore, of 1896, being obtained by multiplying the maximum load of 1896 by 8,784 (i. e., 366 days by 24 hours), and of 1897 by 8,760.

"Though it appears to be the custom at every works to record the maximum load, the 'units generated' are in the majority not arrived at by meter, but by calculation, and in some by a process which one of my correspondents describes as 'cooking.'"

There is another point to be learned, namely, the percentage of units generated which are unaccounted for. This percentage is even greater in gas companies, and it is interesting to watch the reports from year to year, and to see the improvement in this matter. The Massachusetts report of all the gas companies of that state, gives the exact number of feet unaccounted for in each company. These items, added together, in 1897 amounted to 285 million feet. One gas company lost 36 per cent. of its output, and quite a number over 20 per cent.

The largest percentage of unaccounted-for units in the English electric stations generating over a million units appears to be 12½ per cent. Quite a number having an output of 500,000 units have 33 per cent. One station loses 47 per cent.

These figures with respect to electric lighting are not comparable with gas, for the reason that we allow the larger portion of the loss as necessary to the distribution. I have no doubt that a great saving may be made in our stations if attention is brought to this feature.

To go back to the total cost per unit, we find, comparing again the English stations, as I have been unable to obtain such data on American stations:

Total Costs.

Units sold (kilowatt hours) Between	1894 Year of operation	1894 Cost per unit sold (Cents)	1895 Year of operation	1895 Cost per unit sold (Cents)	1896 Year of operation	1896 Cost per unit sold (Cents)
100,000 and 200,000	1st	[illegible]	2nd	[illegible]	3d	[illegible]
200,000 and 350,000	2nd	[illegible]	3d	[illegible]	4th	[illegible]
350,000 and 600,000	3d	[illegible]	2nd	[illegible]	1d	[illegible]
600,000 and 1,000,000	4th	[illegible]	[illegible]	[illegible]	2nd	[illegible]
1,000,000 and 1,500,000	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
1,500,000 and 2,000,000	7th	[illegible]	2nd	[illegible]	2nd	[illegible]
2,000,000 and 2,500,000	5th	[illegible]			[illegible]	[illegible]
2,500,000 and [illegible]	6th	[illegible]	[illegible]	[illegible]	3d	[illegible]
3,500,000 and upward.			5th	[illegible]	6th	[illegible]

We find the cost of coal varies from $3 [illegible] to $5 per ton, and yet the cost of fuel per unit has been kept down in a great many plants to one cent. So far as I am advised, there is only one state in our union which gives such data officially, namely, Massachusetts.

A very interesting report of one of the continental plants is that of the polyphase station of the Budapester Allgemeine Electricitats Gesellschaft:[1] "This station has been in operation since 1893. The electric light in Budapest is supplied by two large central stations, one working on the polyphase system and the other on the simple alternating system. The polyphase currents are transformed into continuous current by rotaries to 230 volts on the three-wire system.

"The station consists of six 300-kilowatt, two phase generators driven by triple-expansion engines. The coal is Ostrauer nut and makes 7.4 per cent. refuse. On an average during the winter months the efficiency of the entire system is 67 per cent. The results of the plant are given in the following table:

	1894.	1895.	1896.
Gross production	1,200 000 units	1,900 000	2,800 000
Highest load	15,000 16 c. p. l.	17,000	21,000
Lowest load	2,000 16-c. p. l.	3,000	9,000
Gross watt-hours per lb. of coal	432	575	571

"Consumers pay 50 cents a unit for light and 16 cents for power."

I give below the average cost of coal and contract price per arc lamp per year in about 1,000 stations in the United States.[2] No distinction in price per 2,000 or 1,200 candle power is made in averaging on account of the great variation in price; a 2,000 candle power lamp in one place with high-cost coal sometimes selling for less than a 1,200 candle power with low-price coal.

State.	Hours per year.	Coal per ton.	Contract pr. year.	Price pr. hr.	C. P. pr. Hr. for 1c.
Alabama	4,000	$1 92	$ 89	$.022	791
Arkansas	3,396	2.30	121	.034	390
California	2,885	7.00	120	.045	449
Colorado	3 413	3.18	129	.042	558
Connecticut	2,730	4.28	86	.035	452
Delaware	4,000	2.32	110	.028	728
Dist. of Columbia	4,000	....	106	.027	452
Florida	2,179	Wood	118	.054	222

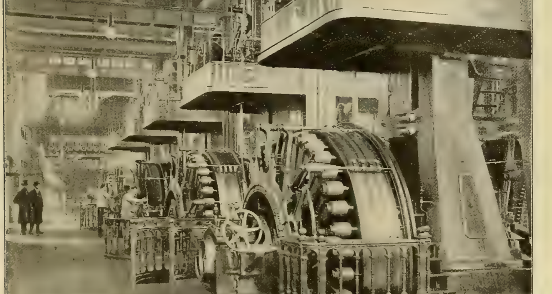
[illegible] states—1,000 central stations.

1 London Electrician, June [illegible].
2 General Electric Company (Lighting Dept Statistics).



ELECTRICAL ENERGY IN PARIS.—DYNAMO ROOM OF THE JEMMAPES CENTRAL STATION.

Statistics on English Lighting Plants.[1]

	K. W.	Cost plant per K W. installed.	Cost per unit.	Average selling price.
Bristol	945	$517	6.38c	10 62
Brighton	1,200	601	4.72c	9 42
Bradford	1,400	255	4.48c	9 56
Dover	525	270	8 34c	10.76

The highest point for cost of fuel of any of these enterprises was 3.24 cents per kilowatt-hour, and the lowest 1.08 cents; but the conditions are so different that an analysis cannot be made, although the Brighton plant is one which is handicapped.

A, B, C and E are large stations, containing the most expensive machinery. No expense has been spared in their construction, and in consequence fixed charges are extremely high.

Station D is a representative city station of moderate cost and high efficiency.

Stations F, G and H are city stations of moderate cost. They are not of absolutely modern construction, but at the time of their erection were as perfect as money could make them.

Station I is a model station of small size, running an extremely variable load.

Station J is a large city station running under favorable conditions.

The points of interest in the table are:

First—Cost of coal. This averages one-half cent per unit. This is less than in the ideal station of Mr. Crompton. We get the advantage of cheaper coal in America. The wages item is less in these railway plants than any English lighting station, but it should be remembered that the figures on these railway stations refer probably to generation only.

If we take the pounds of coal per unit and divide 1,000 watt-hours by it, we will obtain 256.

At this point it is interesting to turn back to your 1896 meeting in New York and to the paper by Mr. Swetland, chairman of the committee on data.

From the examination of 81 reports using coal as fuel the average efficiency is 108 hours per pound of coal.

It is interesting to compare these reports with the Budapest Gesellschaft, where the lowest efficiency for the last three years is 432 watt-hours per pound coal, showing there is yet much to be gained.

Below is the report of some of the Chicago railway plants:[3]

Cost of Operating Railway Plants.

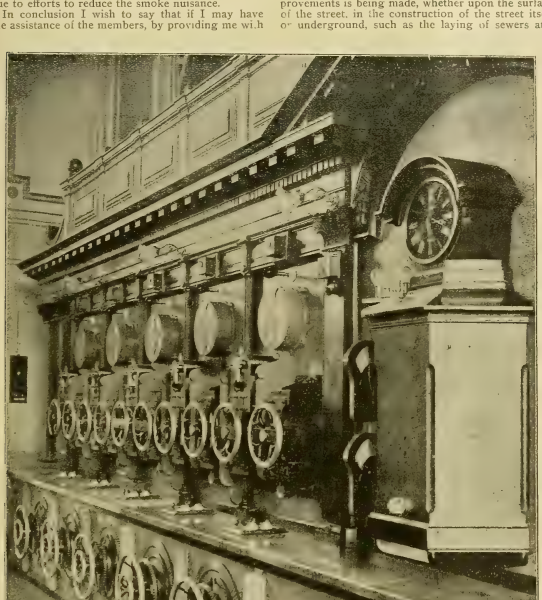
A carefully prepared paper by Mr. Horatio A. Foster on the cost of steam power, and read before the American Institute of Electrical Engineers a year ago, emphasizes the fact that there are very little reliable data on American plants. The plants on which tests were made for cost of power were: Two electric lighting stations, one grain elevator, three

1 Electrical Engineer, p. 393, April 14. Claud P. D'Oyly.
2. Street Railway Journal, January, 1897, L. D. Tandy.
3. Street Railway Journal, May, 1897.

waterworks pumping stations, two flour mills, six cotton mills, four newspaper and printing offices, one department store, one furniture manufactory, one bakery, one glazed and fancy paper manufacturing company. By reference to Mr. Foster's report, it will be seen that in rated capacity the plants vary from 40 horse power to 2,500, and in value per rated horse power from $23 to $89 in steam power plants, or as high as $368 in waterworks pumping stations. While the type of boiler used leans largely to the plain, old-fashioned return tubular, with the exception of the cotton mills, the types of engines are almost as varied as the number of plants. In fuel, soft coal or slack of soft coal largely predominates, and a considerable use of mixtures of the latter with dust from the yards and hard-coal slack will also be noticed, which is largely due to efforts to reduce the smoke nuisance.

In conclusion I wish to say that if I may have the assistance of the members, by providing me with data, by next year I can prepare a more helpful paper, going more carefully into the question of calorific value of the different coals used and to the different types of plants.



ELECTRICAL ENERGY IN PARIS.—SWITCHBOARD OF THE JEMMAPES CENTRAL STATION.

DISCUSSION.

President Insull: In connection with Mr. Rice's able paper we have arranged for a discussion on "Prices and Discounts for Electric Current and Methods of Billing Current to Customers," which is so closely interwoven with the subject of Mr. Rice's paper that they might both be discussed together.

Mr. Scovil: In the beginning of Mr. Rice's paper is the following paragraph: "In America the variation in the investment per kilowatt is $200 to $750 per kilowatt capacity installed. In a few cases the figure is below $200, and in a few as high as $1,000, but in the great majority of cases the cost is below $400." I would like to ask what is meant by the word investment?

Mr. Rice: As I understand the data given in the literature which I have quoted, it covers the entire investment of developing waterworks, that is waterworks plant, the steam plant, buildings, real estate, distributing system, whether underground or overhead, clear to the motor or lights in the consumer's plant.

Mr. Scovil: Does it cover royalties?

Mr. Rice: As far as I know it does.

Mr. Ayer: There is a note in the paper where it speaks about the losses or unaccounted watts developed in the lighting station, as compared with gas; I wish to ask Mr. Barker his understanding of it. Is it not a fact that the gas losses are due to condensation quite as much as the watt losses are due to line losses; in other words, are there not in both cases losses in distribution?

Mr. Barker: The occasions for the loss in the gas distribution are largely leakage in the pipe. The matter of condensation loss, if gas is properly made, can be reduced to very low percentage, and the large percentages of loss in cases about which you hear occasionally are due to actual leakage. We always find where a large system of street improvements is being made, whether upon the surface of the street, in the construction of the street itself or underground, such as the laying of sewers and water-pipes or even the laying of underground electric conduits, that the amount of leakage in the gas-pipes and the loss from the amount manufactured is greatly increased.

Mr. Coggeshal: I will state that the loss of output by alternating current from the 1st of January to the 1st of April was 53 per cent.; we collected for 47 per cent. I account for it from the fact that the loss largely existed in the transformers. Our day output is small; we run 24 hours the whole year, and as far as we can indicate it, the loss in the daytime for about eight hours is equal to 24 hours' power, without receipts to amount to anything.

Mr. Wagner: I would suggest that the loss may be accounted for in the fact that the meters do not register the full amount of the current which is used. From my observation I would say that the figures are nearly correct for the usual alternating current stations in small cities. The inefficiency of distribution is rarely much over 50 per cent., the loss aggregates nearly 60 per cent. With a direct current station it is somewhat less.

Mr. Dow: I should like to get a certificate of the accuracy of the statement regarding the Budapest system. It gives the gross watt-hours per pound of

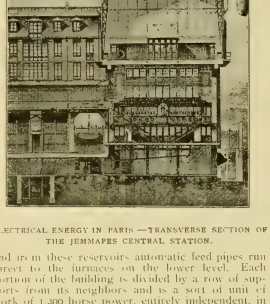
[*Continued on page 387.*]

Electrical Energy in Paris.

The accompanying illustrations give an excellent idea of the electrical station Quay Jemmapes, on the bank of the Saint Martin Canal, Paris, and are reproduced from l'Energie Electrique. The buildings cover a rectangular space of 5,400 square meters. The location is favorable, as the proximity of the canal furnishes easy means of steam condensation and transportation and delivery of the necessary fuel. A boatload of coal per day will be called for when the entire plant is in operation. Twenty-five units of 750 kilowatts, similar to the five already in use, are to be installed.

The main buildings contain the engine and dynamo rooms, shops and accumulator rooms, facing the canal. There is an office and administrative building. The buildings for accessory services occupy the center of the premises and are separated from the former buildings by a street five meters wide. The last group comprises four buildings, extending from front to rear. The first, in front, incloses the elevator pumps and sundry service of the plant; the second contains the water filtering and evaporating apparatus; the third commands the passenger and freight elevators and stairways; the fourth is utilized as a repair shop and a storehouse.

In order to do away with the constant wear and tear, due to trembling where machines are placed above the first floor, broad, massive foundations were sunk below the ground level, and on these were bedded the huge machines, after the manner of similar American installations. But as these required a space of but 14 meters in length, and the dynamos, which are direct-connected, required 17.30 meters, the second floor overhangs the ground floor a sufficient amount to accommodate them, and did not require additional strengthening of the timbers. The coal receptacle, being above also, required an additional support in the way of columns,



ELECTRICAL ENERGY IN PARIS.—TRANSVERSE SECTION OF THE JEMMAPES CENTRAL STATION.

and in these reservoirs automatic feed pipes run direct to the furnaces on the lower level. Each portion of the building is divided by a row of supports from its neighbors and is a sort of unit of work of 1,300 horse power, entirely independent, in every particular, of the rest of the plant.

The two receptacles of each division will store together 140 tons of coal, which, as before stated, is delivered automatically on the fire grates; there are also water reservoirs in each division capable of holding 20 cubic meters of water.

To properly insulate the platform of the generators there are three successive impermeable layers of planking, each independent of the other, and to further augment the safety, the generators are set in iron pans filled with plaster. The cables are brought to the switchboard through a closed subterranean gallery, insulated from the rest of the underground rooms to prevent all possibility of accident. Two canals between the foundation walls and the intermediate walls bring water in for condensing purposes and return this to the outer source when its mission is performed. That which supplies the condensers has a diameter of 1.10 meters, leading from the Canal Saint Martin, while the return is effected through two branches of .9 of a meter each in diameter.

Four boilers form a battery serving one group of engines and dynamos. These four boilers are rated to furnish 10,000 kilograms per hour, and, with the coal commonly used in the Parisian stations. The grate surface is 5.23 square meters, or 56.92 square meters for each battery of four boilers, and the heating surface is 865.52 square meters for boilers, steam dryers and reheaters. The engines have cylinders of 805 millimeters diameter for the lesser and 1,350 millimeters for the larger, and the stroke is 1,200 millimeters. Each fly-wheel has a weight of 31,000 kilogrammes and a diameter of 5.7 meters, cast in two sections, and bolted.

The dynamos develop 1,500 amperes at 500 volts—750,000 watts—but are capable of increasing the capacity one fifth. The switchboard comprises three divisions, connected by bus-bars, which, when the plant is complete, will have a cross section of 10,000 square millimeters.

The Canadian Electrical association will hold its convention at Montreal next week, and the preparations for the gathering indicate that the meeting will be in keeping with the history of the organization. The list of papers to be read is presented elsewhere. Many interesting topics are included, and the meeting should be interesting to practical men particularly.

Attention has already been directed to the agitation for improved facilities in conducting patent-office business. No industry is more interested in the expedition consideration of applications for patents than the electrical interests, and the announcement that the president has approved the act of Congress mentioned last week appropriating money to largely increase the working force of the Patent Office will be hailed with delight by inventors and manufacturers alike. The necessity for legislation to relieve the congested condition of affairs which now exists in the Patent Office has been obvious to inventors for years, but owing to shortsightedness this end has always been defeated, on the ground that it would entail the expenditure of large sums of money. Those who are familiar with the subject call attention to the fact that the Patent Office annually turns into the United States Treasury over $200,000, after paying all its runnig expenses. This of itself justifies the expenditure, it would seem, as the inventors and manufacturers of the country are certainly entitled to prompt and accurate service, and this can only be obtained by providing additional force.

It is now several years since the American Institute of Electrical Engineers has held a general meeting in the West, and for this reason alone the gathering at Omaha next week should include many who could not conveniently attend the meetings that have been held in eastern cities. There are many other reasons why the attendance of western members should be large. The exhibition at Omaha is now in an advanced stage, and those interested in the practical application of electricity will find much to occupy their minds. It is needless to say that the theoretical and historical features have not been overlooked or neglected. Both the Institute and the exposition should profit by the gathering at this time.

Among the subjects that will be discussed at the meeting of the Independent Telephone association in Chicago on June 30th will be the patent situation, the Berliner action, inter-municipal and long-distance connections and improvements in service of this nature. The advancement that has been made in this department since the last meeting will lend interest to the discussion. The president says that the meetings will be open to members only. It seems that an organization of this character, appealing to popular sympathy and support, should hold public meetings at which popular subjects could be discussed. It is hard to enlist public support for a secret movement, and it is even harder to maintain interest among the members of the organization under such conditions. The experience of the old Telephone association is sufficient to prove the futility of such efforts, and other organizations of similar character have fallen by the wayside, simply because they failed to command public support. The subject should be carefully considered by the organization before it becomes irrevocably committed to executive sessions.

The electrical industry will be interested in the proposition now under consideration by the government to investigate the trade relations of this country with China. The State Department has asked Congress for an appropriation of $20,000 for the purpose of sending a commission to China to study the commercial conditions of that country as they affect those of the United States. American manufacturers find that they can fill a larger demand than that of the home market, and they are looking to other countries, especially in machinery, electrical apparatus, hardware, bicycles and other manufactures of iron and steel. The State Department, through its consular representatives, is making strenuous efforts to advance the commercial and industrial conditions of the country, and secure the trade of South American countries. The Far East, and especially China, presents equal opportunities, which European countries are even now cultivating. China has a population of 400,000,000, and its foreign commerce amounts to about $200,000,000 annually. Great Britain obtained about two-thirds, Japan one-eleventh and the United States one-twelfth in 1896. American products are already popular in China, and statistics show an increase in our export trade to China from $8,117,059 in 1893 to $17,078,065 in 1897. This includes only merchandise transported directly to that country.

In a singularly infelicitous introduction to its report of the recent meeting of the National Electric Light association in Chicago, the Electrical World of New York gravely remarks that "The city chosen is a little outside of the center of distribution of central stations, if, in their moments, the relative size is considered." The reference to the "moments" of central stations is mysterious; but, if it is eliminated, the meaning of the sentence seems to be that Chicago is rather an out-of-the-way place to hold a convention of the really important central-station men of the country. If the Electrical World is correct in this assumption, it seems too bad that the fact was not impressed on the members of the association, as, by reading the World's account a little farther on, it is seen that it was decided "to hold the annual meeting in May or June each year, alternately in the cities of New York and Chicago, unless otherwise directed by the executive." And this despite the announcement of our inapt contemporary that "Western central stations are, as a rule, comparatively small, and their officers oftentimes unable to spare the time and money involved in the long trip from anywhere in the West to Chicago."

Western men did much for the success of the Chicago convention, and the foolish and untruthful characterizations of our contemporary will not be relished. The Electrical World assumes to represent the development of the industry in the country at large, and it will scarcely add to its popularity in the West by making silly and invidious distinctions.

The formation of a corps of electrical engineers in England seems to have been retarded because the uniform selected did not meet the approval of the fastidious volunteers. One of these dress-parade soldiers has written the London Electrical Review that "a friend on hearing that the uniform of the Electrical Engineers Volunteers was to be the same as that of the volunteer battalions of the Royal Engineers at once gave up all idea of joining the corps, although he was very keen on being a member when he first heard that such a regiment was to be enrolled. He is now making arrangements to join the Yeomanry Cavalry, as, to use his own words, he will then be able to walk through the public streets in uniform without being insulted and his friends will not be ashamed to speak to him." This singular statement is explained by the fact that "the great majority of the British public always associates the red coat with that useful but much maligned body of men, viz., the militia." It has been suggested that a compromise be effected, owing to the fact that "it is now too late to do away with the red tunic." It is proposed that the "facings be such as to be entirely different from any other regiment."

In this country, it is safe to say, the engineers who offered their services to the government never gave the matter of uniform a thought. They had more serious business on hand, and had no time for show. Besides, the men who wear Uncle Sam's uniform can always "walk through the public streets without being insulted."

American telephone exchange managers may find material for reflection in the report of the parliamentary investigation into the workings of the British telephone service. It was developed in the course of the inquiry that the National company, which has a practical monopoly of the business, had more subscribers and charged a higher rate for service than the government at Newcastle, where there was a Postoffice exchange in competition with the National system. It was also announced that the government service was not conducted at a loss, as had been assumed, but really returned a fair profit to the government. Upon the subject of granting franchises to competing companies there seemed to be no room for doubt as to the position of all concerned. The government officials were as firmly opposed to the plan as the corporation's representatives. It was admitted that there was good reason for complaint, and that there had been demands for competition in many places. Several cities had applied for rights, but to all these petitions the government had turned a deaf ear. The Postoffice officials denied that they were influenced in reaching this decision by a desire to favor the National monopoly. They believed that the telephone business, like the telegraph, should be conducted by the government, and ultimately would be assumed by the Postoffice. For that reason alone they opposed a division of the business at present. It was generally admitted, however, that there was no hope of immediate relief, as the British public had not had sufficient time to become thoroughly aroused. Possibly by 1911, when the National company's license expires, the government may be ready to take action. Until that time, however, the public must make the best of a poor service.

WAR NEWS.

Volunteer Engineers.—Provision has been made for the temporary headquarters, for enlistments, of two regiments of the brigade of volunteer engineers for the army. The First Regiment will have headquarters in New York and the Second Regiment in Chicago. This brigade of engineers has been provided for by a special act of Congress. Each regiment will consist of one colonel, one lieutenant-colonel, one adjutant (first lieutenant), one quartermaster (first lieutenant), one surgeon, two assistant surgeons, one chaplain, one sergeant-major, one quartermaster-sergeant, one chief musician, two principal musicians and three battalions. Each battalion has one major, one adjutant (first lieutenant), one quartermaster (first lieutenant), one sergeant-major, one quartermaster-sergeant, one hospital steward and four companies. Each company will consist of one captain, one first lieutenant and second lieutenant, eight sergeants, eight corporals, two musicians, 45 first-class privates and 28 second-class privates. Total: Commissioned, 33; enlisted, 1,106; aggregate, 1,159. The company pay list has been fixed by the government as follows: Captain, $2,000 a year; first lieutenant, $1,600; second lieutenant, $1,500; adjutant (first lieutenant), $1,800; quartermaster (first lieutenant), $1,800; sergeant-major, $43.20 a month; quartermaster-sergeant, $43.20; sergeant, $40.80; corporal, $24; first-class private, $20.40; second-class private, $16.80. Uniform and clothing. Each recruit is required to pass a strict examination in regard to his engineering capabilities, as well as to his physical health. His height must not be less than five feet four inches, and his weight not less than 120 pounds nor more than 190. The equipment of the men will comprise that of the infantry, while their uniforms will be similar to those worn by the engineer corps in the regular army. While in camp the troops will be armed and drilled as infantry, as they are classed as line troops, and if called upon must take their place in the line of battle. The officers have been selected for their skill as military, civil, electrical, mechanical and topographical engineers, while the men who will be accepted must be proficient electricians, telegraphers, steam engineers, surveyors, dock-builders, divers, sanitary engineers and mechanics of various trades, who will be useful in the construction and destruction of fortifications, field work, intrenchments, bridges, roads, railroads and field engineering work generally.

The officers of the First Regiment include several prominent electrical men. Eugene Griffin of the General Electric company is the colonel. Colonel Griffin is a West Pointer, and had a record of 14 years as an army officer before going with the Thomson-Houston company. Dr. Louis Duncan of Johns Hopkins University is one of the majors. He is also a former army officer, while his standing as an electrical engineer is of the highest. William B. Parsons, chief engineer of the Rapid Transit Commission of New York, is a captain. Among those who have offered as privates is William Edison, the second son of Thomas A. Edison, and many other electrical men.

In Chicago the examination of candidates for the positions of officers in the Second Regiment was held during the week at Indiana avenue and Sixteenth street by Colonel Willard Young, the commander. Recruiting offices will be established at Springfield, O., Cincinnati, Indianapolis, Chicago, St. Paul, Omaha, Denver, Salt Lake City, San Francisco and Portland, Ore., to which recruiting officers and agents will be assigned by the regimental commander. The camp of the First and Second Battalions is established at Fort Sheridan; for the Third Battalion, at the Presidio, Cal. The First and Second Battalions will be made up as follows: First Battalion, two companies from Springfield, O., two from Cincinnati and one from Indianapolis; Second Battalion, two companies from Chicago, one from St. Paul and one from Omaha. G. A. Hurd of the Crane company is a candidate for a captain's commission.

The Signal Service.—Captain Edward Bernard Ives, recently appointed and confirmed a captain of volunteers, has undertaken to secure recruits for the Signal Corps in New York and Brooklyn. Fifty men are wanted. Reference will be given to applicants from the Signal Service of the National Guard. Under the law, two-thirds of the entire number of recruits required must be skilled electricians and telegraphers.

A signal corps from the Volunteer Signal Service Corps, which is being recruited and established at Tampa, under the command of Major Samuel Reber, has established telegraphic connection between General Coppinger's field headquarters and the Western Union headquarters.

A Chattanooga dispatch states that Major Glassford of Camp Thomas is swamped with the applications of those who desire to enter the Signal Corps. He has received 500 in the last week. Almost all of those applying are men of high professional rank.

Major R. E. Thompson, chief signal officer of the expeditionary forces to Manila, will sail with General Merritt, and is now preparing to go at an hour's notice. The Signal Corps is yet lacking in its required quota of expert telegraph operators, who will perform an important part in the conquest and government of the Philippines. Fifteen are coming from St. Paul, to be followed by others from eastern cities. Major Thompson will leave an officer in San Francisco to enlist men for the corps and forward them, together with necessary supplies, to Manila.

At Tampa a company of engineers has been formed from the men of the First Illinois Regiment. The captain is Taylor E. Brown, a member of the firm of Poole & Brown, patent lawyers in Chicago. He is supported by Lieutenants Laramie and Curran. The company will be a part of a battalion of selected engineer troops.

Arthur C. Parsons Appointed Lieutenant in Navy.—Among the late appointments announced by the Navy Department was that of Arthur C. Parsons, who was made lieutenant in the navy on June 17th. Lieutenant Parsons' commission reached Chicago on Monday morning and he immediately qualified. He expects to enter active service at once.

Lieutenant Parsons is 40 years of age and is well qualified by training and experience for his new duties. He was born at Keokuk, Iowa, on June 25, 1858. At the age of 18 he entered the United States Naval Academy at Annapolis, being named by the Hon. George W. McCreary, then member of Congress and later secretary of war. After being graduated in 1881 Mr. Parsons was assigned to duty on the old Brooklyn and saw two years' service on that boat, cruising in South American waters. At the expiration of that period he was honorably discharged under the act of Congress of August 5, 1882, limiting the number of graduates of the Naval Academy to be retained in such service.

It was not until June, 1890, that Mr. Parsons entered the electrical field. He has been identified

LIEUT. ARTHUR C. PARSONS.

with the Edison interests since that time. He gained his first experience with the Edison General Electric company, being assigned to the railway-construction department. While following this branch of the business he did considerable pioneer work throughout the West and visited Milwaukee, Fort Scott, Kansas, La Salle, Ill., Chicago, Eau Claire, Wis., and Boise City, and in the latter city started the first electric street railway in Idaho. He operated the line for some time. He had charge of several installations and was engaged in various capacities in many of the electric railway enterprises that were then being established. In November, 1891, he returned to Chicago and was assigned to the stationary motor department. For a short time he traveled for the Chicago office of the Edison General Electric company, but later was occupied with the city trade, and has ever since made Chicago his home. In July, 1892, he entered the service of the Chicago Edison company and has been connected with the contracting department of that company for the last six years. In all that time he has been engaged in the South Side territory and is well acquainted with that district.

Lieutenant Parsons was one of the most popular members of the Chicago Edison company's staff, and when it was learned last week that he had been appointed lieutenant in the navy, his associates determined to celebrate the event by a dinner at the Grand Pacific Hotel. The affair proved an enjoyable event. Louis A. Ferguson presided as toastmaster and several excellent speeches were made.

Before going to Washington Lieutenant Parsons made a short visit to Keokuk, where his parents still reside.

Telegraph and Telephone War Taxes.—The Washington correspondent of the Western Electrician directs attention to the special provision of the war-revenue measure, which was passed last week, providing that after July 1st no telegraph company or its agent or employe shall transmit to any one either a dispatch or message without an adhesive stamp denoting the tax imposed by the act being affixed to a copy thereof, or having the same stamped upon it. A default of this provision will incur a penalty of $10. But it is provided that only one stamp shall be required on each message or dispatch, even though it be sent to more than one company. The only exceptions made are in the cases of messages or dispatches of the officers or employes of any telegraph or telephone company on affairs concerning the company, messages or dispatches of like persons on railroads and government official business. The law governing the operation of telephone lines is as follows: "It shall be the duty of every person, firm or corporation owning or operating a telephone line or lines to make within the first 15 days of each month a sworn statement to the collector of internal revenue in each of their respective districts, stating the number of messages or conversations transmitted over their respective lines during the preceding month, for which a charge of 15 cents or more was imposed, and for each of such messages or conversations the said person, firm or corporation shall pay a tax of one cent. Provided, that only one payment of said tax shall be required, notwithstanding the lines of one or more persons, firms or corporations shall be used for the transmission of each of said messages or conversations. Tax on telegraphic dispatches is also one cent for each message.

Cable Communication.—Whether all the cables connecting Cuba with the rest of the world have been cut is a question that still remains unanswered. As late as June 19th it was reported that the remaining Santiago-Kingston cable had been cut the night before by Captain Goodrich of the auxiliary cruiser St. Louis. It was stated that the cable was cut off Santiago, within a mile of the shore batteries. Still, there have been so many cable-cutting cable-cutting stories—so many submarine wires have been cut, apparently, without effective result—that only an official announcement can be accepted as conclusive.

A Madrid dispatch in the American papers states that on June 15th, in the Chamber of Deputies, General Correa, minister of war announced that telegraphic connection with Santiago and Guantanamo had been broken. The government, it was said, was consequently without news as to whether the Americans had landed at either of those places.

Another phase of the situation is brought up by the statements that the American commanders at Manila and Santiago will endeavor to secure the ends of severed cables, and, with the proper men and instruments, open direct communication with Washington. The point has been made that the cable companies, operating under fran chises granted by neutral governments, may feel obliged or may be instructed by their respective governments to refuse to forward over those parts of their lines which are in neutral territory messages sent by Admiral Dewey or Admiral Sampson for transmission to Washington. It is said that dispatches from Dewey have thus been "held up" by the British operators at Hongkong. On the other hand, it is reported from Washington that the French cable company owning the line from Santiago has agreed to allow the transmission of all messages from Sampson as soon as the cable shall have been repaired and fitted with the necessary instruments for the operators. Concerning the question of the rights and duties of the cable companies, Theodore J. Harper of New York, said to be a well-known international lawyer, says: "The law of nations does not compel those at peace to abandon their usual occupations. I see no reason why a cable owned by citizens of a neutral nation, on neutral territory, may not continue impartially to send all messages received from any source whatsoever, without involving in any way the violation of the laws of neutrality." In other words, there would seem to be no reason why companies may not refusing to forward Sampson's dispatches, providing all messages filed in the neutral territory, at Mole St. Nicholas, were also allowed to be transmitted.

It is stated that the direct cable communication with Cuba, under military direction, is important to the Washington authorities, has now been secured. General Greely is said to have received from Lieutenant-Colonel Allen on June 21st a dispatch stating that the first American military station in Cuba, Camp McCalla, Guantanamo Bay, had been brought into electrical communication with the rest of the world by the establishment of a telegraph office, which was opened at five o'clock. The French cable company, whose line runs from Santiago to Guantanamo Bay, and thence to Cape Haitien, where a direct connection is obtained with New York, was directed to restore communication with Guantanamo, with permission to send commercial and domestic dispatches, under a strict military censor-ship necessitated by war conditions.

Searchlights.—The Yale, the Harvard and the Minneapolis, refitted at Newport News, will be furnished with extra searchlights of the highest power. It is said that these three ships will have more searchlights than any other vessels in the navy when they are thoroughly overhauled.

Ten large electric cars, manufactured in St. Louis, have just been shipped from Newport News, Va., aboard the German steamer Pisa, for Hamburg. These are said to be the first American manufactured electric cars to be shipped to Germany, and are to be tried as an experiment in competition with German manufactured cars.

DEVELOPMENT OF THE TELEPHONE FIELD.

Telephone News from the Northwest.

[From the Minneapolis correspondent of the Western Electrician.]

James Gibbs, an electrician in the employment of the Marshall Telephone company, Marshalltown, Ia., died recently of a hemorrhage.

The E. H. Martin Telephone company of Webster City, Ia., has added a calculagraph for computing time on toll messages.

H. W. Doolittle is the new manager of the Mutual Telephone company of Des Moines.

Manson, Ia., will vote July 1st on granting a franchise for a telephone exchange to the Central Telephone company.

Work has been begun on the Home telephone exchange at Centerville, Ia., It is to be in operation by August 1st.

J. W. Christie, manager of the Minneapolis office of the Northwestern Telephone Exchange company, has been promoted to assistant superintendent, with jurisdiction over the lines in Minnesota and the Dakotas. He is succeeded by H. G. Webster, formerly manager of the Grand Forks office.

Bain Brothers have bought the telephone line between Trenton, Ia., and Gilman City, and will put it in the best possible shape.

The new telephone exchange at Litchfield, Minn., is completed.

The Merrill, Wis., Telephone company has 215 instruments in use, and orders for 15 more have been filed. Another section has been added to the switchboard lately.

Work has been begun on the telephone exchange at Albia, Ia.

North Branch, Ia., wants the Mutual Telephone company to extend its wires to that place, and it will probably be done.

There is talk of a telephone line being built from Biddick City, Ia., to Strand.

The Jefferson Telephone company contemplates extending its toll lines to Rusk, Pocahontas, Rolfe, Havelock, Plover and Mallard, Ia.

Lamberton, Minn., has granted a franchise to the Northwestern Telephone Exchange company.

Two cables of the Iowa Telephone company, crossing the river between Davenport, Ia., and Rock Island, Ill., were accidentally burned by the explosion of a gasoline forge, and the service between the cities was crippled until repairs could be made.

The Minnesota Mutual Telephone company proposes to extend wires to connect with Grantsburg, Wis.

The Central Telephone company proposes to extend its wires to Baxter, Ia.

The Northwestern Telephone Exchange company has inaugurated some extensive changes and improvements in its exchange in Sioux Falls, S. D. The switchboard has been enlarged, new and taller poles have been set and a mile of aerial cable set.

The Northwestern Telephone Exchange company is expected to extend its wires to Kerkhoven, Minn.

Electric-light Wires as Telephonic Circuits.

F. J. Jervis-Smith of Oxford, in Nature, describes a method of using electric-lighting wires as telephonic circuits. He was requested some time ago to try to localize a fault in an electric-light main, by means of a certain form of inductor used in conjunction with a telephone but not connected to the main. While using it, it occurred to him that probably the main might be used instead of a telephone wire. His first experiments were not productive of good results, as a small fraction of the company's current passed continuously through the telephone. In October, 1897, he placed one-third-microfarid condensers in his telephone circuit at each end; these stopped the current, but in no way reduced the telephonic effects. If the note given out by virtue of the rotation of the armature of the dynamo is great, it can be very greatly reduced by placing an inductively wound resistance in the circuit. The resistance, he writes, does not appear to modify the telephonic effects in any marked degree. This probably arises from the fact that the electromotive force due to the secondary coil of the telephone transmitter is high. The experiment was successfully made over two miles of a main, which was carrying the full load used in lighting the town.

Extensions and Improvements.

F. G. Blaisdell's franchise for the erection and maintenance of a telephone line at Yuma, Arizona, was extended 90 days on May 26th, as he desires to make some improvements.

Increased facilities for telephonic communication have been afforded by the National Telephone company and the Postoffice at Hereford, and the town is now connected with the trunk service.

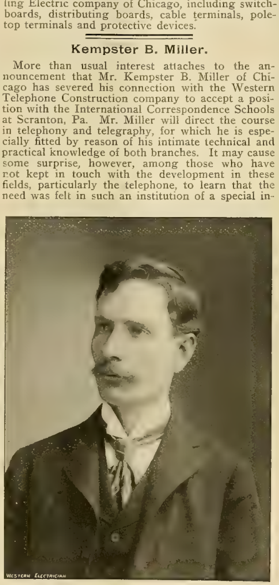
The E. H. Martin Telephone company of Webster City, Ia., is rebuilding [illegible] plant. The multitude of overhead wires [illegible] in [illegible] wire cables, the cable terminals, the protective devices and the switchboard being of the Bell type manufactured by the Sterling Electric company of Chicago.

Experiments have been made with the telephone between Manchester and Brussels, the operators at the two cities being put in direct communication with each other. Both land and sea wires had to be utilized, the wires running from Brussels through Courtrai and Lille to Calais, where they were connected with the London-Paris telephone cable under the Straits of Dover.

The Valley Telephone company, operating in Saginaw, West Saginaw, Bay City, West Bay City and Flint, will probably have all of its exchanges in operation before July 1st. It is said that the engineering work upon these exchanges is of the highest class, the conduit work, the cable work, the pole-line work, the inside wiring, and the arrangement of the exchanges themselves being models of workmanship and of perfect arrangement. This company is equipped with the full line of the Sterling Electric company of Chicago, including switchboards, distributing boards, cable terminals, pole-top terminals and protective devices.

Kempster B. Miller.

More than usual interest attaches to the announcement that Mr. Kempster B. Miller of Chicago has severed his connection with the Western Telephone Construction company to accept a position with the International Correspondence Schools at Scranton, Pa. Mr. Miller will direct the course in telephony and telegraphy, for which he is especially fitted by reason of his intimate technical and practical knowledge of both branches. It may cause some surprise, however, among those who have not kept in touch with the development in these fields, particularly the telephone, to learn that the need was felt in such an institution of a special in-



KEMPSTER B. MILLER.

structor on these subjects. In making a selection for this position the management of the school certainly found an experienced and capable expert of high standing in the profession.

Mr. Miller was born in Boston on August 14, 1870, and entered Cornell University at the age of 19 years, taking the course in electrical engineering. He continued in this institution until 1893, when he was graduated. In the meantime, however, he gained considerable practical experience in the Thomson-Houston works at Lynn, where he spent his vacations in the draughting-room. On completing his course at Cornell he took the civil-service examination, and within a month received an appointment as fourth assistant examiner in the United States Patent Office at Washington. During the three years he remained at the Patent Office he was occupied in examining claims in the class of telephony, which gave him an excellent view of the telephone field, and he became particularly familiar with the patent situation. He left the Patent Office in January, 1896, to accept a position with the Westinghouse Electric and Manufacturing company at Pittsburg, and to patent several inventions made during his term in the Patent Office. He did not stay with the Westinghouse company long, however, but accepted a position with the Western Telephone Construction company as chief electrician. During the last two years he has held that position, and has also been engaged as expert in a large number of patent cases for that company.

Mr. Miller has written considerably upon telephony as viewed by the independent manager, and he has been an earnest advocate of good construction and high class service. He has also taken an active interest in the subject of securing the adoption of standard diagrams of electrical apparatus by the Patent Office. Mr. Miller was a valued member of the Chicago Electrical association and was an influential factor in the work accomplished by that organization.

English Telephone Investigation.

The parliamentary investigation committee which has been enquiring into the condition of the telephone service in England has devoted considerable attention to the terms of the public grants under which the service was being given. It seemed to be the general impression that the National company had given preference to its own subscribers in the use of trunk lines in spite of the understanding with the government and the contract with the Postoffice Department. Among the witnesses examined was F. T. Lamb, second secretary of the Postoffice, who said that his special department was the telegraph and telephone service. He was in charge of the telegraph department since April, 1889, and for many years before he had had a great deal to do with it. He had been concerned in the administration of the telegraphs since 1870. He gave evidence before the committee of 1892, and also before that of 1895. The principal recommendation of the committee of 1892 was that the license of the telephone company should not be extended beyond 1911. It left the government the responsibility of entering into arrangements with the telephone companies, and made the recommendation that the license should not extend beyond 1911. He had a hand in drawing up the treasury minute, in the sense that he prepared the information for the Postoffice, which was embodied in that minute nearly word for word. That information was prepared in view, at any rate, of limited competition. All along the Postoffice and the Treasury had in view competition, and freedom of competition was reserved carefully from the earliest date, and it was again reserved in that minute. In 1892 agreements were drawn up, but were not signed. The heads of the agreement were embodied in the agreement of March 25, 1896. The final agreement was with one company. In response to the question, "Did the Postoffice encourage the amalgamation of these two companies?" the witness said: "It was not a question of the Postoffice. It was a question of the government, which gave direct instructions to the postmaster-general. The postmaster-general was in constant communication with the chancellor of the exchequer, and, acting for the government, he facilitated the amalgamation of these companies. Practically, the amalgamation had taken place when the heads of the agreement were signed." Continuing, the witness explained that in 1889 Mr. Raikes was postmaster-general, and offered strong opposition to the amalgamation. Not only was there no opposition to the amalgamation in 1892, but it was rather encouraged by the postmaster-general acting on behalf of the government. The agreement undoubtedly facilitated the amalgamation of the National Telephone company with the New Telephone company, and was signed with the full knowledge of the chancellor of the exchequer and other members of the government. The formal signatures were attached on August 11, 1892, in Sir James Fergusson's room in the House of Commons. The witness had been in constant attendance at the House of Commons with the postmaster-general, and was present at discussions, and he knew that the postmaster-general acquainted the chancellor of the exchequer of what was going on.

Concerning the development of the industry, the witness said that the trunk system had gone on extending since 1896. Thirty extensions had been carried out or were being carried out under guarantee by the company. The miles of wires purchased for the company were 29,000. The miles of wires constructed were 24,526. The mileage in course of construction at the present time was 4,647 miles. The mileage guaranteed was comparatively small. With regard to the areas of the company, the principles adopted in making them were as follows: Industrial areas of wide extent should be recognized in cases where there are any considerable towns forming centers of business; neighboring towns intimately connected with one another in business relations should be included in the same area, and small towns and villages, in any one of which it would be hopeless to establish a local exchange system unless there was some cheap means of communication with each other, should be grouped together in one area. All urban districts were areas in themselves. Pretty well the whole of the country was divided into areas in which the National Telephone company had the power to establish an exchange without further license. The company was under no obligation to start an exchange, but the Postoffice could grant a license to any other body to start an exchange. Since the agreement was signed in 1896 in only one case had the monopoly of the telephone company been broken down, in Guernsey. The charges there were low, but he did not know that they were lower than the company was prepared to supply the service at. Changes had been made in the areas from time to time, the tendency having been to rather increase the area. The largest area was London. The area was not nearly so big as in some places abroad. There was no limit on the discretion of the Postoffice as to laying trunk wires. The only effect a large area had was to reduce the use of short trunk wires. In a number of those areas they had Postoffice exchanges competing with the National Telephone company's exchanges. The principal exchange was at Newcastle-on-Tyne, where they had 626 subscribers. The

number of subscribers to the National Telephone system in Newcastle-on-Tyne was much larger. The charges of the Postoffice were: For business houses, £8 within half a mile of the exchange, £9 within three-quarters of a mile, and £10 within a mile. He believed the charge of the company was a uniform one of £10. Previous, however, to October of last year the Postoffice charged £10 for half a mile, £12 for three-quarters of a mile, and £14 for a mile. The Postoffice charges were based on what was supposed to bring in a profit to the taxpayer. The management was not allowed to canvass, and not allowed to give preference to firms. The company gave preferences, but he could not say to what extent the preferences had been given by the company. The reduction in the price at Newcastle was bringing an increase in the number of subscribers. The Postoffice had offered to put its subscribers at Newcastle in communication with the subscribers of the company, but the company was not willing that that should be done. The Postoffice had no legal power to insist upon such a connection.

The chairman asked: "Do you know any towns where there is competition in which the price charged is lower than where there is no competition?" To which the witness replied: "I do not think that is so."

"You do not think competition has had any effect upon their prices?"

"I cannot tell what effect it has, but, as a matter of fact, the company's charges are higher in Newcastle than in other towns, probably because they are smaller towns."

"Is it not a fact that the company's prices are based on your charges?"

"I think that is so."

"You have been in unequal competition owing to higher rates?"

"Yes."

"Without disclosing secrets could you tell the committee whether you have made any loss?"

"No."

"And we may say you have made a fair profit."

"Yes."

"Although there are two competing systems?"

"Yes."

"Are the charges of the company higher in Cardiff and Swansea?"

"For certain distances I think they are."

"Is it in the interest of the public that the National Telephone company should not have the competition of the Postoffice?"

"I find it very difficult to answer that question. My opinion is that it is very undesirable for a private company to have a monopoly. On the other hand, I am firmly convinced that the establishment in one town of competing systems of telephones would not be in the interests of the public. My opinion is that the whole thing should be in the hands of the Postoffice."

It was announced that there was no effective competition between the New company and the National, for the New company had no exchange. The competition in Manchester was a very feeeble competition. The tendency of the policy of the Postoffice since 1892 had been toward making the National Telephone company a monopoly, but at the same time all the rights of the postmaster-general had been fully preserved. The heads of the 1892 agreement were brought before the House of Commons in 1894, when it was laid on the table. The Treasury minute lay in the House in May, 1892, and the bill to raise the money for the purchase came before the House on May 26, 1892. The agreement was signed August 11, 1892, and the postmaster-general went out of office on August 19th. The agreement was signed the day the vote of censure on the government came in.

Some of the Postoffice subscribers in Newcastle had been obliged to become subscribers also to the National Telephone company.

General application had been made by local authorities and other companies for licenses to start telephonic services in different towns, and they were ready to comply with the terms of the Treasury minute. The postmaster-general had been in consultation with the chancellor of the exchequer on the subject, and they had not seen their way to granting those licenses. They had received applications from the corporations of Glasgow and Tunbridge Wells and Manchester, and in Glasgow it was admitted that the service was defective, yet in no case has a license been granted.

The government would not allow municipal bodies to establish telephonic systems in places where there was no service, but would leave it to the Postoffice. The Postoffice had not established many services of late years, because there was no demand for them. From a commercial point of view, it was not an unreasonable system for the company to adopt. His remedy would be to take over the whole system, and put it in the hands of the Postoffice.

When the legal proceedings against the telephone company were going on the Postoffice submitted proposals to the Treasury for establishing telephones, and in a letter dated December 16, 1880, the Treasury consented, on the understanding that it would enable the department to negotiate satisfactorily with the telephone companies. He believed that great inconvenience to the public would arise if they had competitive systems in different places. It would probably take eight or nine years for the Postoffice to establish a really proper competitive system over the country. In Sweden the state had bought up all the local districts, with the exception of one. In France there was no private company, and in Italy there never had been a private system. The only place where there was a municipal service was Holland, and in that country the trunk lines were in the hands of the government. Some facilities had been given by the government to the telephone company outside the agreement.

Analysis of the Cost of the Generation and Distribution of a Unit of Electricity.

[*Continued from page 377.*]

coal as 575 and 571. It is specifically stated that it is gross watt-hours and the station is described as a station where the loss would be quite high. Mr. Rice has no doubt given the statement careful consideration.

Mr. Ferguson: The Budapest station pays more for coal than we do. They pay $4 or $5 a ton, so that the figure 571 is possible. It costs them more for coal at Budapest than it does at our best American stations.

Mr. Dow: With all due respect to the Budapest station, I do not think the figures are correct. The main engine alone might accomplish that result; but to get the whole output down to such a figure seems to be out of the question. There is a mistake of about 200 watts.

Mr. Creden: The Chicago Edison company generates a kilowatt on about 4½ pounds of coal, equivalent to about 28 pounds, which gives an evaporation of about six pounds on an average day's run. Coal used in Budapest would safely give about 10 pounds on an average, which readily accounts for the large number of watts generated. The Chicago Edison company generates about 250 watts per pound of coal. The coal will give an evaporation of six pounds, perhaps a trifle less, on a run of 24 hours. The coal at Budapest is of a better quality and will give an evaporation of 10 pounds, which will account for the high figure specified. I think the figures presented by Mr. Rice are about right. They are possibly a trifle high, but not as high as Mr. Dow represents.

President Insull: I have here a chart which shows the average cost of various operations in connection with our operating expenses, except the interest portion of the operating expenses. I present this to you now as it is a matter bearing not only on my own remarks, made a short time since on the question of cost and selling price, but also upon the paper just read. These figures are taken from our actual balance sheet of the year. The largest amount of expenses is general expenses. The reason for that is that one-third of the expense is in getting new business, one-third administrative expenses and the balance insurance, taxes and similar items. Other items, which are simply average items for the year, could be treated in the same way. For instance, take the question of street repairing, that item will go down continuously until you get your system in such shape that that item will not bear any particular relation to the amount of your output unless the output exceeds the capacity of your conductors. The biggest item of expense apart from the general expenses is, as Mr. Rice indicated, lamp renewals, when he referred to the question of regulation being more important than the question of economy. The important point that the chart brings out is the interest cost. You might have all of your operating expenses presented to you outside of interest and then you might lose money, if your selling price is not on the right basis. Take a case of a 3.7 load-factor, an office building, and not an extreme case, the interest charge is 80 per cent. of the total operating charges. Here is a case of an ordinary fancy store—these cases are taken from the actual bills—and you see there that the interest charge is a little less. The importance of the interest charge in this case will be brought home to you when I tell you that the difference between six and five per cent. in the price you pay for your money and whether you sell your bonds at 90 per cent. or sell them at par, makes a difference of 16 to 20 per cent. in the cost of operating expenses. That statement alone will show you that the public is more interested than we are in the question of protecting us in the enjoyment of our right to do business. Now we come to an all-night restaurant where the load-factor is 48 per cent. and the interest charge is only 26 per cent. of the total expenses. These are the two extreme cases I mentioned to you in my opening remarks. In one case you could sell current to a man at about a quarter of what you could sell it to another man and make more money out of the first man than out of the second man. You will find that the same relation goes all the way through with the different classes of business. Power business is not quite as good as all-night lighting business. The load-factor is about 35 per cent. and the interest expense about 32 per cent. With a dry-goods store the interest is about 40 per cent., a small lunch counter 45 per cent., and a saloon 52 per cent.

It is generally supposed that the best business is the power business. I remember in the early days when the rates were established to foster the power business of the Edison Electric Illuminating company of New York, the claim was made that you could afford to sell power at one-half the price, if your current was going to be used for power when it was not going to be used for light. We have found that the power curve and the light curve cross each other for 60 days during the winter, and the claim which was made for the power business proved a fallacy. Large stations can get a class of business which will yield a bigger return on investment from lighting customers than from power customers at a low rate, because the interest cost, if you have a 50 per cent. load-factor is only 25 per cent. of the total cost; whereas with power customers the interest is about 35 per cent. This chart, properly studied, should enable a man running the Chicago Edison company to make a price-list that would fit all kinds of customers. If we can do that in our business, surely you can do it in your business. You will find, too, that the adoption of a system of rates that will take care of these different conditions will affect these items very materially. It will not affect lamp renewals, of course. It will certainly affect station repairs, general supervision, station labor, fuel and also general expenses. In other words, it will affect by far the greater proportion of your expenses outside of interest charges, beside very materially affecting your interest charges, by putting your revenue on a basis so that it is in proportion to the interest you have to pay to take care of a customer whom you are supplying with current. You are putting your business on a basis so that you get a return on the investment which you have to provide for each separate customer. This subject came up for discussion last year at Niagara Falls. One gentleman, whom I am sorry is not here to-day, took the ground that we had to sell the product at the same price to everybody. If you do you are selling your product at different prices to everybody, because in one case you can make money, and in another case you lose money. Take, for instance, the case of an office-building customer. His business won't enable you to pay interest and depreciation on the investment. You may have to take him as a good business policy, but do not imagine when you put on 5,000 lights in an office building, that you are going to make any money on them. If the expenses of a station are followed out in this way you can get a great deal more out of the method by which you sell than you can out of the method by which you produce.

Mr. Armstrong: What would you call your standard rate? What would be your base rate?

Mr. DeCamp: Do you establish a base rate for the least desirable customer and work down, or make a base rate on the most desirable customer and work up?

Mr. Insull: It is simply a question whether you are going to figure on lamps connected, which is fallacious, or adopt some scheme which enables you to register the maximum load.

Mr. Hubeley: How can you regulate that plan on a meter basis; different rates for different services?

Mr. Insull: There are various ways of arriving at that.

Mr. Hubeley: I do not see how it could be done on a flat rate, on a contract basis. I do not see how you could do that without a great deal of computation.

Mr. Insull: Do you mean a meter flat rate or contract basis?

Mr. Hubeley: Contract basis; so much a month.

Mr. Insull: We would go into the hands of a receiver on that basis.

Mr. Hubeley: Do you use meters here under that plan?

Mr. Insull: Yes, sir.

Mr. Barker: You spoke of the different classes of business earning a certain percentage on the investment. How do you apportion the investment among the different classes of business?

Mr. Insull: On our maximum output per year. We take an investment of that kind, and divide the one by the other, and get the investment per unit at the maximum output. Then we get the maximum demand for current from the customer, and in that way we can figure his load factor. We know what it costs for our investment per maximum unit of output, and we know our customers' maximum demand.

Mr. Hubeley: How do you know that?

Mr. Insull: There are a number of ways of arriving at it. We use a Bristol recording wattmeter and the Wright demand meter.

Mr. Wendell: In towns of 25,000 people there are a number of small consumers whose maximum demand may not be five lights. They are very desirable customers. What would you do in their case?

Mr. Insull: If your smallest customer is a man who burns one light, and burns it five hours a day, he is likely to buy it at a rate of a little over one-half a cent per lamp-hour.

Mr. Wendell: How small a customer can you afford to take?

Mr. Insull: It depends upon the efficiency of the lamp. If you will give us a 25-watt lamp, we will take a customer whose demand is 25 watts.

Mr. Wendell: Can you afford to do that with the Wright demand meter? On what number of lamps do you use the meter?

Mr. Ferguson: We take every and any customer on that basis, and we have a uniform schedule of prices for everybody, based on one cent per lamp per hour; that is the base rate. We charge the full rate of one cent per lamp per hour for one hour per day as the maximum demand, and for all watt hours beyond that hour we charge a half-rate, 40 per cent. or 60 per cent., or anything that you please. In regard to the question of what customers you can afford to take, that would involve a great deal of calculation. The simplest way is to charge a minimum bill to each customer, which will cover

the smallest customer. If you charge a minimum bill for services furnished, that will cover interest and depreciation charges on the cost of the investment used.

Mr. Scovil: I would like to know whether the chart which you have shown and the percentages you gave do not include a great many motors that are used for electric power, such as elevators?

Mr. Creden: Yes; it does.

Mr. Scovil: I simply want to have it understood that Mr. Insull's deduction from his chart as to the desirability of power as a load-factor on the station is not altogether to be accepted from the showing made by the chart, for the reason that that chart includes in it many motors used on electric elevators in which the power factor is very small. Motors used for manufacturing purposes only have a much higher power-factor, and are entitled to a much better rate.

Mr. Insull: I do not say power is not desirable business, and I do not wish you to think that we do not take it.

Mr. Coggshall: You charge one rate for one hour a day, and another rate for the rest of the day. How do you do it?

Mr. Insull: That is called the two-rate system. It is done by a meter with two dials or a double meter.

Mr. Wagner: I understand from your remarks that the Chicago Edison company is going to use the Wright demand system of charging, which is a very thorough way of providing for all these different classes of services. I should like to know if there is anyone else here who accomplishes nearly the same thing by any other method?

Mr. Dow: We have more than 25,000 people, but we have not money enough to buy Wright demand meters for all our customers just yet. We are going to do so some day. However, we use demand meters on a number of customers. We use them when there is doubt of arriving at the demand by any other means. We do not believe it necessary to leave them on continuously, but we put them on long enough to make certain that we have a fair average demand for the current 12 months, and in such cases we make the demand established by meter, and base a contract on it with the customer for the current 12 months. We say to them that they shall pay for that amount for 12 months, at the maximum rate, and everything beyond that at a minimum rate, and at the end of 12 months we will again meter in the same way, and reserve the right to put the meter on at any time to satisfy ourselves as to what the actual demand is. In some places we leave the meters on continuously.

Now to answer the question raised as to how anyone has reached the same result by other means. In the matter of arc lighting practically nine-tenths of the business is with customers whose lamps are all turned on at once. If a man has 10 arc lights he is likely to use all at the same time, so that in the majority of cases the arc lamps will be an exact measure of the demand. With certain classes of motors the same thing applies, not with all classes, by any means, because there is nothing that is more frequent than a motor running at a much less load than it is rated. They seldom use continuously any length of time the maximum. The matter of elevator motors, to which Mr. Scovil referred, is in that line. There is a large amount of motor business where you can put on an ammeter and ascertain the largest demand. As we are situated now we have been trying to develop the motor business, and inspect motors frequently, and we have not so many that a faithful man cannot visit them all in five weeks. We are not missing anything, but our method of checking depends on personal knowledge, and can only be looked upon as a makeshift. It does not compare with the method of gauging the arc lights, but as a temporary device it fills the bill. Beyond that you have still another class of customers, small barber shops, saloons, cigar stores, news stands and fruit stands, that use only a few lights and keep open long hours. They are good customers. Beyond that is the general use of incandescent lights, where some meter must be used. It limits the necessity of the application of the demand meters to one part of the business, and that may be one half or one-third of the whole business. If there is any place in the world where a demand meter is a good thing, it is in a residence. In the absence of the meter system in residences we have instituted a method of assessment according to the number of rooms in a house and the number of persons likely to use the light.

Mr. Wagner: How do you arrive at the assessment you speak of?

Mr. Dow: We inspect each house and make a list of the rooms and the number of lights in each room; and we make a charge accordingly.

Mr. Wagner: You have to collect all the data for each customer?

Mr. Dow: With the residence customers only.

Mr. Wagner: We have 75,000 incandescent lamps in St. Louis.

Mr. Dow: We have 24,000.

Mr. Robinson: In [illegible] scheme for the adoption of the Wright demand system I found a certain class of business that I did not know how to handle. It comes from lodges, churches, etc.

Mr. Dow: Mr. Wright maintains strongly that the relation of the demand, maximum customers' demand, and the time at which the demand takes place, is of no consequence; but I feel that it is, so I reclassified all these certain lines of business, which includes these troublesome customers mentioned, who think they ought to have special rates. I have churches, lodges, schools, banks and fire-engine houses on a special basis, in the last-named case because we use some of the fire-alarm telegraph poles. Our annual peak is due to the 60 days' crossing of motor and lighting loads. The banks are off before the great bulk of business comes on. I established for them, on the same set of calculations, a rate which is equitable, and known as the church, bank or lodge rate. It is got at in the same way.

Mr. Wagner: I would like to hear more about the details of the system of the Chicago Edison company.

Mr. Ferguson: Mr. Dow made the statement that he could not afford to buy demand meters, that he would do it after a while, but cannot afford to do it now. After listening to what he said, I think he is much mistaken. I think he is spending too much of his valuable time in attempting to understand the personal characteristics of his customers. I am sure that if he does that properly, if he ascertains the characteristics of his customers so well that he can approach the work done by the Wright demand meter, he must employ a large force of assistants, and when we consider that the cost of demand meters is small in proportion to the total investment, and that an immense amount of business can be obtained by using the demand meters, I think he can well afford to buy them. We will suppose that in Chicago we have 5,000 customers, and the cost of the instruments would be something like $50,000 for all these customers. We do not spend all the entire sum in one year; it would take some time. Our business has improved largely by the use of the meter, and we cannot get instruments fast enough. It seems to me that any central-station man can well afford to borrow the money, even at a very high rate of interest, and purchase the meters. The additional business that you will get by the use of such instruments will more than compensate in a few years for the total investment. We have listened to papers in these conventions showing the economy to be effected in generation and distribution and that sort of thing. It seems to me that there is more money to be made in the intelligent selling of your product than in attempting to introduce further economies in operation. With an instrument like the Wright demand meter you are put in a position where the instrument does for you what you will otherwise have to do by skilled labor at a very high cost. I say this from experience. For three years I have personally negotiated contracts for the Chicago Edison company on a basis similar to that described by Mr. Dow. I have had customers come into the office and have talked with them to ascertain the conditions under which they burned their light and made prices, with 15, 25 and up to 65 and 75 per cent. discount, depending on the conditions under which they used the light. Since we have put in the Wright demand system the work is lessened; I am able to give my attention to other things, and let the meter do the work for me. There are other ways, of course, of getting at the information, and we have used them. We have used, for instance, the Bristol recording ammeter, which is useful for ascertaining the maximum load in any customer's premises. It is slow and can only be used in large installations, like hotels, and theaters, where you desire to make a uniform discount for the entire year, which is practically the same as selling current on the Wright demand system. It is the load-factor system; the only system based on load-factor. If you know by the Bristol recording instrument that the load-factor is 50 per cent., you can make the rate for the entire year at a uniform discount, which is the same as putting in the Wright demand instrument. But it is tedious and much more expensive than buying the instruments and making them do the work for you.

In further reference to this question of dealing individually with customers, especially in residences, upon which Mr. Dow dwelt particularly, the load-factor varies greatly, and you cannot classify residences; it is almost impossible to do so. We will have a rich man, for instance, who has 200 lights in his house, at $25 a month, and another man with 25 lights and his bill is $20 a month. They would be entitled to a 25 per cent. discount on the basis of 25 cents per kilowatt-hour for the first hour and 20 cents per kilowatt-hour for the succeeding hours. The load-factor would be over 20 per cent. Theaters use light at a high load-factor; they run for short periods, and the load factor is small. Hotels are about 50 per cent. and large dry goods houses 50 per cent., and residences vary all over the line. We have not made any increase since starting in with the Wright demand system. We have not published the fact that we are selling electric light on that basis as yet. We have, however, instructed our men to take all new business on that basis. We sell arc lamps at a flat price per week from dusk to midnight. With the exception of that and the power business it is all done on the Wright demand basis. We put our arc light and incandescent light on the same meter. The reading of the demand meter is made at the same time as the reading of the wattmeter. The wattmeter is placed on the wall and the demand meter under it. The latter is graduated in kilowatt-hours, the same as the wattmeter. [Mr. Ferguson then drew a diagram on the blackboard, illustrating the methods of charging for current, which he explained to the meeting.]

Mr. Weeks: There have been few discussions before this association, Mr. President, of greater importance to central-station interests than that to which we have just listened. In the cost of our product the relative value of the interest factor has been forcibly and clearly shown, and the necessity for revision of rates or discounts has been ably demonstrated. In my judgment, the method employed by Mr. Insull, or a slight modification of it, will soon come into general use. In one respect, however, the practice as stated strikes me of questionable equity, if not expediency, and I would like to ask what has been the effect upon your revenue of the lowest rates for summer service?

Mr. Insull: We do not know yet. We only put it in operation during the last few weeks.

Mr. Weeks: It seems to me that it is somewhat inequitable to make a lower rate for transient summer service, such as the customer who operates a fan but a few weeks or months at most in the year, while his rate on account of the interest factor should be higher rather than that for most other classes of service.

Mr. Insull: We have a large by-product that we want to sell, which usually lies idle in the summer; and we endeavor to dispose of it to these occasional users.

Mr. Weeks: What has been the effect of the Wright system, which is admirable, and will undoubtedly be the system of the future, upon municipal lighting? What would be the rate on municipal lighting, run as the average municipal light does?

Mr. Insull: It would be very low.

Mr. Weeks: Have you determined that?

Mr. Ferguson: The municipal light runs about 12 hours. It depends whether it is a moonlight schedule or an all-night service. It would not get as low as you are selling it now. You can readily see that if you make the rate 20 cents the first hour, and 10 cents for everything after that, the maximum discount will not reach 50 per cent. It is something higher than that now. It is the same as if you figure 10 cents per kilowatt-hour. You will have to make the second rate low enough so as to figure out the same kilowatt-hour as you are now charging for the arc-light service. That must be arranged in each individual city.

American Institute of Electrical Engineers.

The fifteenth general meeting of the Institute will be held at the Millard Hotel, Omaha, Neb., beginning on Monday, June 27th, at 10 a. m. Daily sessions from 10 a. m. to 1 p. m. will be held on Tuesday, Wednesday and Thursday, and the following papers will be presented:

"Inaugural Address," by the president, Dr. A. E. Kennelly of Philadelphia.

"The Dielectric Strength of Air," by C. P. Steinmetz of Schenectady, N. Y.

"Two-wire Distributing Systems and Lamps at 220-240 Volts," by John W. Howell of Newark, N. J.

"A Capillary Electrometer for Electrical Measurements," by Charles F. Burgess of Madison, Wis.

"Alternating-current Transformers from the Station Manager's Viewpoint," by W. F. White of Omaha, Neb.

"The Graphical Treatment of Alternating Currents in Branching Circuits, with Special Reference to the Case of Variable Frequency," by Dr. H. T. Eddy of Minneapolis, Minn.

"Some Phases of the Rapid-transit Problem," by Albert H. Armstrong of Schenectady, N. Y.

"The Evolution of the Line Signal," by Arthur V. Abbott of Chicago.

"The Commutated Curve of a Composite-wound Alternator," by D. C. Jackson of Madison, Wis.

"Alternate-current Working for Laboratory and Testing Purposes," by Harris J. Ryan of Ithaca.

"High-voltage Power Transmission," by Charles F. Scott of Pittsburg, Pa.

"Preliminary Report of Committee on Standardization," by Dr. Francis B. Crocker, chairman.

"Transmission and Distribution of Power for Railway Service," by Ernst J. Berg of Schenectady, N. Y.

"The Education of Electrical Apprentices and Journeyman," by Arthur A. Hamerschlag of New York.

"Air Gap and Core Distribution—The Magnetic Flux and its Effect upon Regulation and Efficiency of Dynamo-electric Machinery," by W. E. Goldsborough of Lafayette, Ind.

"The Imperial Electric-light, Heat and Power Plant of St. Louis," by George A. Damon of Chicago.

"Some Tests with an Induction Generator," by A. F. McKissick of Auburn, Ala.

Members may avail themselves of the special excursion rate fixed for the Trans-Mississippi Exposition, which is $14.75 from Chicago to Omaha, or $48.50 from New York to Omaha. These round-trip tickets will be good until July 5th, or by special endorsement until August 30th.

Rooms at the Millard Hotel, which will be the Institute headquarters, are from $1.50 upward on European, and $3 upward on the American plan. Rooms will be reserved for members, but, to avoid misunderstanding, notice should be sent direct to hotel.

The secretary announces that members from Chicago and the East should arrange to leave Union Station, Chicago, by the 5:50 p. m. train on the Chicago, Burlington and Quincy railroad, Sunday,

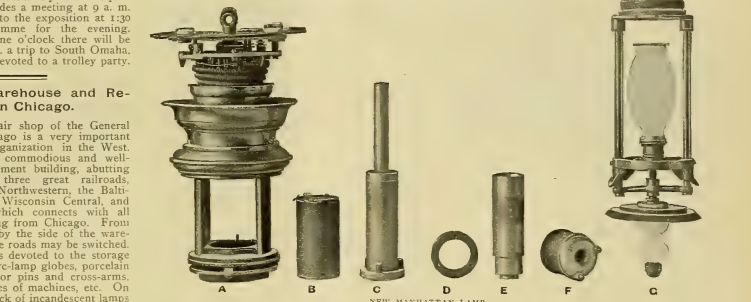
June 26th. In order to make this connection, members from New York and the East should leave New York city by the 1 p. m. train on the West Shore railroad, Saturday, June 25th, which is due at Chicago at 4 p. m. on June 26th.

Special cars will meet the delegates at the depot in Omaha on Monday morning and will take them to the Millard Hotel for breakfast. At 9 a. m. the Institute will meet in the Bee building, 1706 Farnam street, and at 2 p. m. there will be an excursion to the Omaha Smelting Works and Union Pacific shops. At 7:30 p. m. a complimentary initiation by the Knights of Ak Sar Ben will take place. The programme for Tuesday includes a meeting at 9 a. m. and a complimentary trip to the exposition at 1:30 p. m., and special programme for the evening. Wednesday morning at nine o'clock there will be a meeting, and at 1:30 p. m. a trip to South Omaha, while the evening will be devoted to a trolley party.

General Electric Warehouse and Repair Shops in Chicago.

The warehouse and repair shop of the General Electric company in Chicago is a very important part of that company's organization in the West. These branches occupy a commodious and well-lighted six-story and basement building, abutting on the main lines of three great railroads, namely, the Chicago and Northwestern, the Baltimore and Ohio and the Wisconsin Central, and also on the Belt line, which connects with all the other railroads radiating from Chicago. From these, into a special spur by the side of the warehouse, the cars of any of the roads may be switched.

The top or sixth floor is devoted to the storage of unbroken packages of arc-lamp globes, porcelain and glass isulators, insulator pins and cross-arms, armatures of the older types of machines, etc. On the fifth floor is stored a stock of incandescent lamps in original packages ready for immediate shipment, fan motors, arc-lamp globes in broken lots, arc-lamp carbons, etc. At present the incandescent lamps in stock number roughly about 500,000, and this number is kept constantly on hand by weekly shipments from the Edison Lamp Works of Harrison, N. J. The fourth and third floors are laid out in floor bins and wall cupboards, the latter divided into pigeon-hole boxes ready for immediate shipment. Each bin and each pigeon-hole bears the catalogue number of the device or part it contains, and so well is the arrangement that a boy could fill from the bins and cupboards any order for supplies, large or small. On the fourth floor are the larger wiring supplies and parts, arc lamps—single and double-carbon series and open and enclosed arcs for direct or alternating circuits—car resistances and meters and type "H" transformers of all sizes in the original Electric company; suffice it to say, that no order, however large or insignificant, but can be filled from this stock. The second floor contains the repair shop, fully equipped with lathes, planers, drill presses and shapers, all driven by electric motors. The front part of this room is given up to the armature-rewinding department. On this floor is located also an elaborate meter, lamp, and transformer-testing department, as well as a dip room and polishing room for refinishing arc-lamp casings, etc. On the first floor are stored all the heavy machines—generators, motors and the large-sized transformers.



NEW MANHATTAN LAMP

This is also the shipping and receiving room for all the stock, and one corner is devoted to the office, while in the rear is a small carpenter shop, with planer and a circular saw, driven by a five horse power motor. An overhead track equipped with traveling-chain hoists runs above this floor and out over both railroad tracks and the street, and greatly facilitates the shipment or reception of the cases of supplies or apparatus. Along one side are large bins, each labeled with the name of a railroad or express line. In these bins are placed the cases for shipment, so that they may be shipped out rapidly without confusion or mistake. By a special arrangement with the express companies, four shipments, the last at 6 p. m., are made daily. Thus express orders leave the warehouse the day they are received at the office.

The warehouse was arranged and is under the care of George M. Ellis.

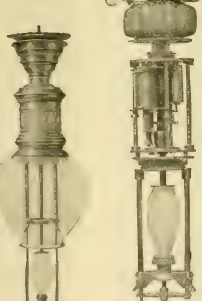
GENERAL ELECTRIC WAREHOUSES AND REPAIR SHOPS



NEW MANHATTAN LAMP

factory boxes ready for reshipment at the shortest notice. In the bins on the third floor are the smaller wiring supplies and parts—fuses, sockets, switches, cut-outs, lightning arresters, arc-lamp parts, dynamo-motor parts, brushes, both copper and carbon, line material of all kinds, controller parts, rheostats, assembled commutators and a full stock of the new GA motors, as well as a heavy stock of insulated cord and wire. The attempt to enumerate all the devices kept in stock in this warehouse would be to transcribe the supply catalogue of the General

The basement contains the power plant, consisting of two 80 horse power boilers and two horizontal engines, one of 100 horse power, used for dynamo-testing purposes, the other, a 50 horse power engine, belted to a direct-current machine from which the lighting and power current used in the building is supplied and to a 30 kilowatt alternator used for meter and other testing purposes. The basement also contains a boiler-feed pump, a water heater, a large fire pump, four large steam head blocks for baking armature and dynamo field coil, and a switchboard divided into three sections equipped for testing high-tension series arc machines, direct-current, low-tension machines and alternating testing work. The load for the first consists of a bank of arc lamps, also in the basement, for the second a large water rheostant under the sidewalk, and for the alternating section a large bank of incandescent lamps on the second floor. Beneath the sidewalk is kept a large stock of insulating oil for transformers. The different floors are connected by a four-ton elevator.

The repair shop is in charge of L. G. Crawford.

New Manhattan Lamp.

Many changes have been introduced in the design and construction of the new Manhattan enclosed arc lamp, although many of the features of the old type were found so valuable that they were retained. The principal changes are briefly outlined herewith:

The length of 36 inches has been reduced to 29 inches.

New lamps may be furnished to take the old style of trim, or the new style of trim may be furnished for old lamps now in service.

The novel feature of lowering the bulb down through the opening in the bottom of the outer globe on double telescoping rods has been introduced.

The cap used in the new Manhattan lam is provided with a gas chamber, which materially lengthens the life of the carbon.

The mechanism shell may be lowered while the lamp hangs in position by removing the trim and outer globe and giving the central cylinder a quarter turn, when the shell may be removed and current adjustment of the lamp changed.

The adjustment of the rheostat for voltage may be made by loosening set screws and lowering the split canopy at the top.

All the mechanism below the armature has been dispensed with, and the only moving part in the lamp is the armature, inside of which, however, is a ball clutch. The armature and clutch may be removed from the lamp while it hangs in position by undoing one nut.

One of the sources of danger to short arc lamps has been that the arc is so close to the mechanism that there is a likelihood of burning out of magnet. This has been provided against by the use of a ventilated magnet, and a current of air is constantly passing between magnet and central tube.

The steady burning of the old type lamp depended absolutely upon perfection of the air chamber, which caused variation in burning of different lamps, also great nicety of manufacture, and it was impossible to make lamps altogether interchangeable. In the new lamp there is no such chamber, and a loose fit is maintained between all of the parts. In addition to the air chamber, in which the armature works in the old lamp, a further chamber was provided around the clutch, making it necessary to take the shell off in a most convenient manner, and great care had to be used in replacing insulation at this point, which made the old lamp most difficult to assemble. This has also been remedied in the new lamp.

To remove the magnet the lamp may remain hanging in position. The operator should take off globe and frame G, unscrew cap F, when there may be taken out the armature E; then unscrew the nut D, and the central tube C and the magnet B may be slipped out of the frame A, and every part of the lamp is separated. The lamp may be assembled by the reverse operations.

By an improvement in the electrical and mechanical design of the magnet and armature, the new lamp will be found to burn within very narrow limits and with great steadiness.

The new type Manhattan lamp has been designed for service on circuits of 220 volts, and the same lamp can be transferred from a 110 to a 220 volt circuit by the substitution of another coil and rheo-

stat and a change of the nut holding the armature. The same standard new type Manhattan lamp is also arranged to burn two or more in series on circuits of from 200 to 600 volts by a change of the magnet coil.

The new-type Manhattan alternating enclosed arc lamp contains a different form of mechanism, but the trimming device, outer globe, gas-check plug, carbon sheath and shell are the same as used on the direct-current lamp, and these parts of the two lamps are interchangeable. The trim of the old-type Manhattan lamp is also interchangeable with the new

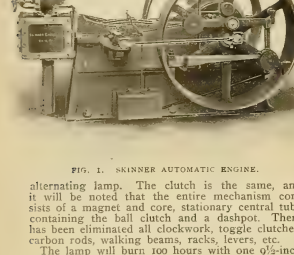


FIG. 1. SKINNER AUTOMATIC ENGINE.

alternating lamp. The clutch is the same, and it will be noted that the entire mechanism consists of a magnet and core, stationary central tube containing the ball clutch and a dashpot. There has been eliminated all clockwork, toggle clutches, carbon rods, walking beams, racks, levers, etc.

The lamp will burn 100 hours with one 9½-inch by ½-inch upper and one six-inch by ½-inch lower carbon, and the unburned portion of the upper may be used as a lower for the next run. On circuits of 100 volts and six amperes the lamp consumes 450 watts. The length of the lamp is 29 inches.

The lamp may be adjusted by a simple change

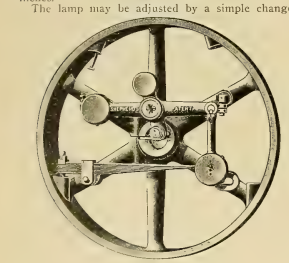

FIG. 2. SKINNER AUTOMATIC ENGINE.

of connections on the top plate for circuits of from 7,000 to 17,000 alternations, and has a range of adjustment for voltage of from 90 to 130 volts.

The outer globe is suspended on a white enameled ring about 7½ inches in diameter, and being directly over the arc acts as a reflector and materially increases the efficiency of the light.

One special point in connection with this lamp is that the carbon sheath is removable from the lamp.

These Manhattan lamps are manufactured under

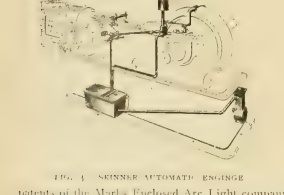

FIG. 3. SKINNER AUTOMATIC ENGINE.

patents of the Manhattan Enclosed Arc Light company, Messrs. Odum, Mas Harris and others.

Death of Stanley S. Stout.

Stanley S. Stout died at the Meadow Brothers' Hospital last Saturday after a short illness. He was a patent lawyer and for six years served as an examiner of applications in the United States Patent Office. During recent years his practice has been largely in the field of telephone litigation, and he conducted the defense of the Western Telephone Construction company when the Bell interests attempted to enforce the Watson patents. That litigation resulted disastrously for the Bell interests, the court declaring the patent to have been worthless. Mr. Stout was a prominent member of the Marquette Club of Chicago.

Skinner Automatic Engine.

The accompanying illustrations represent the Skinner self-oiling automatic engine, which, outside of its handsome design and massive proportions, has many features of exceptional merit. The engine uses the slide valve, balanced within 20 per cent., and is guaranteed to remain steam-tight for five years without any attention from the operator. This valve is operated by a governor of peculiar construction, consisting of an eccentric arm, weight and spring. Mounted in a wheel on frictionless roller bearing, requiring no lubrication, it is the only type of governor that will maintain perfect regulation in which friction is entirely eliminated. Its regulating qualities, the manufacturers say, are remarkable, as it will maintain the same regulation with steam pressure ranging from 30 to 100 pounds.

The speed of engine can be changed 40 per cent. by simply bolting on or taking off weights, and maintain the same regulation, without any other adjustment of the governor. The manufacturers guarantee that this governor will maintain a regulation within one-half of one per cent., and that the whole load may be thrown on and off the engine instantly, without affecting the regulation over one per cent. The engine will reserve normal speed in six revolutions of the shaft.

The cuts show the engine, Fig. 1, provided with an outside connected governor, Fig 2. Engines are also built with the valve operated by inside connected governor with eccentric on the shaft.

A new system of lubrication is employed, the different parts of which are fully shown in Fig. 3. It furnishes a constant stream of pure oil to every bearing, and in full sight of the operator. After leaving the engine the oil and entrained water coming from the stuffing box are separated, the oil returned to the supply tank on the side of the subbase, which is provided with a filter in which the oil is purified to be returned to the engine in a pure condition.

The engine is just as accessible for examination or adjustment as any other. Any part can be got at in a moment. The manufacturer guarantees that not one particle of oil will reach the exterior of the engine or foundation, and that an engine of 50 horse power can be operated 10 hours per day for one year on a consumption not to exceed five gallons of new oil, which is added from time to time, as required, and at no time will the oil in use show more than one-quarter of one per cent. more friction than the oil taken from the barrel.

The devices that go to make up this system consist of jointed oil feeders, which can be lifted away from the parts oiled, a noiseless positive motion pump, supplying the reservoir above the engine with oil. The pump has 10 times the capacity required. Oil not used is returned to the supply tank through an overflow pipe. An oil and water separator and filter and supply tank are used.

Every part of this oiling apparatus is in plain sight of the attendant, and there is no possibility of clogging and no filtering material to interfere with the circulation of oil. The oil feeders can be removed from the engine by simply unloosening three set screws.

This engine is manufactured by the Skinner Engine company of Erie, Pa.

New York Electrical Society.

The following-named members of the New York Electrical society, who have changed their places of residence, are requested to send their new addresses to the secretary, No. 120 Liberty street, New York:

B. F. Sherman,	L. J. O'Reilly,
R. S. Dobbie,	A. V. Wahlron,
D. D. Book,	Harry Tetlie,

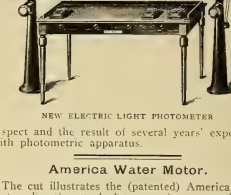
H. C. Sterling, proprietor of the electric-light plant at Huron, S. D., is preparing to change the power from artesian-well water to gasoline engines.

New Electric-light Photometer.

Considerable advancement has been made in photometry as applied to electric lighting, and the latest apparatus placed on the market by Queen & Co. embodies many novel features that will commend it to central-station managers. To begin with, it is a departure from the usual design, as the cut shows. Cast-iron pedestals support the metal photometer bar and carry stages for the support of the lights, screens, etc. The rheostat shown on the left-hand pedestal is for the control of the potential on the standard. It has about 800 or 1,000 steps and permits of perfect adjustment. A similar rheostat on the right regulates the current on the test lamp. The graduated bar is inclined at an angle of 45 degrees, in which position the graduations are lighted by the lamp under test. The screen, which may be of either the Bunsen or Lummer-Brodhun type, is mounted on a truck and may be rolled along the bar wherever desired. A milled head permits of close adjustment when balance is nearly attained. The instrument is said to be complete in every



NEW ELECTRIC LIGHT PHOTOMETER

respect and the result of several years' experience with photometric apparatus.

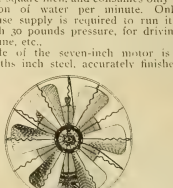
America Water Motor.

The cut illustrates the (patented) America water motor directly attached to a 12-inch brass fan, as manufactured by the A. Rosenberg company, Baltimore, Md. This is said to be the only water motor in the world that is made to tilt or adjust in any direction. These motors are made in two sizes at present—seven inches diameter and nine inches diameter. Both are provided with the polished brass ball and clamp ring for permitting the adjustment or tilting after the motor has been fastened in place or on brackets.

The base or stand is supplied with a leather or felt packing ring, as well as the clamp ring or yoke, making a smooth, water-tight joint between the brass ball and the base or stand, also preventing the brass ball from becoming abraded.

The seven-inch size is especially designed for fan service, or for running a sewing machine, a small dynamo, a telephone exchange generator, a dentist's engine, or other light machinery, such as jewelers' lathes, physicians' centrifugal machine, etc. This seven-inch motor will run about 2,000 revolutions per minute with water pressure at about 60 pounds per square inch, and consumes only seven-eighths gallon of water per minute. Only the ordinary house supply is required to run it satisfactorily, with 30 pounds pressure, for driving fan, sewing machine, etc.

The spindle of the seven-inch motor is made of three-eighths inch steel, accurately finished and



AMERICA WATER MOTOR.

journaled in the very best anti-friction metal made, which can be easily renewed when worn, and the special construction has produced, it is claimed, the only motor that will not leak at the bearings. Motors are provided with two bearings and two oil cups, and have a set-screw of brass at the back of the bearing to adjust the spindle and take up any vibration occasioned by wear.

Canadian Electrical Association.

The annual meeting of the Canadian Electrical association will be held at the Windsor Hotel, Montreal, on June 28th. Following is a list of the papers to be read on that occasion:

"How to Overcome Some of the Difficulties Encountered by Central-station Men." By A. A. Wright.

"The Quimby Screw Pump." By W. T. Bonner.

"Experiences of an Inspector." By Dr. J. K. Johnstone.

"The Electric Current in the Rainy River Gold Mines." By M. W. Hopkins.

"The Importance of Proper Methods of Illumination." By F. A. Bowman.

"Electric Utilization of Water Powers." By Louis DeWitt Magie.

"Economies in the Boiler Room." By James Milne.

"The Unconscious Ownership of an Important Key"—(A Plea for the Introduction of Goods Traffic on Our Suburban Tramways). By W. T. Bonner.

CORRESPONDENCE.

New York Notes.

New York, June 20.—When there is little other technical news in town, there is always the rapid-transit situation to fall back on. That, like the poor, is always with us. Mr. Gould, of the Manhattan company, and Mr. Orr, of the Rapid Transit commission, are still bombarding each other with letters intended for public consumption. Indeed, Mr. Gould complains in his last letter that he has not received a letter addressed to him and published in the daily papers, although he waited several days. Now he wants the letter, if it is intended for him, and also a reply to his company's latest counter-proposition. And so it goes. It is all very tiresome, and there is no real advancement toward a substantial improvement in the rapid-transit facilities of this city.

A rather curious question, in which is involved a lessee's right to bring electric-light wires into leased property containing an isolated plant, came up in court on Saturday. Colonel Edward L. Langford, who is the receiver of the Brighton Beach Railroad company, leased the Brighton Beach Hotel for the season of 1898 to Patrick H. McGann for $6,000. McGann paid $3,000 in advance. His lawyer moved, at a special term of the Supreme Court before Justice Maddox, for an order enjoining Langford from interfering with the Edison Electric Light company and the Brooklyn Gas company in furnishing lights for the hotel. The counsel said that unless the lights were put in the hotel would be in darkness, and a total loss to the lessee. The receiver's attorney said that the proceeding was an attempt to lay pipes or wires on private property without due compensation to the owner. The grounds about the hotel would be torn up, and they had not been leased by McGann. It was contended also that there is now in existence a plant sufficient to furnish lights for the hotel, and the new scheme of the lessee is an unnecessary one. Justice Maddox said that he did not think the receiver could force the lessee to buy lights from the owner unless there was such a provision in the lease. He took the papers and reserved his decision, remarking as he did so that he thought the plaintiff is entitled to put lights in the hotel if he wants to do so. M. S.

PERSONAL.

H. G. Underwood, the patent lawyer of Milwaukee, was in Chicago on Monday, in attendance at the funeral of his former partner, Stanley S. Stout, who died last week.

Mr. E. L. Brayton, one of the officers of the Pelton Water Wheel company of San Francisco, who has been at the company's eastern works for some weeks past, recently sailed for Europe for an extended trip abroad.

P. J. Hertz of the New York office of the Ericsson Telephone company is in Chicago. Mr. Hertz has been in the West some time. He will represent the Ericsson company at the telephone convention in this city on June 30th.

ELECTRIC LIGHTING.

The village of Le Roy, N. Y., has been and is having much trouble with the gas and electric-light question, but the village continues to operate the much-discussed plant. New complications have arisen, which promise to prolong the settlement of the dispute and add to the expense. Many months are likely to pass before it is known definitely whether or not the village will have to retain possession of the plant. Judge White has appointed Hon. Charles M. Tabor of Buffalo to take evidence and submit a report to the court as to what restitution the village of Le Roy should make to the gas company for the use of its plant since possession was taken, which was December 1, 1897. As yet the referee has not given his report, but in the meantime the Le Roy Gas Light company has appealed from the decision of the Supreme Court, which set aside the proceedings by which it was proposed that the village should acquire the plants for lighting. This appeal will be argued in the Appellate Division of the Supreme Court in September. In the meantime the village will probably continue to operate the plants.

ELECTRICAL SECURITIES.

The Edison Electric Illuminating company of Brooklyn has declared a quarterly dividend of 1½ per cent., payable July 15th.

The American Bell Telephone company has declared a quarterly dividend of three per cent. and an extra dividend of 1½ per cent., payable July 15th.

The Southwestern Telegraph and Telephone company has certified to the secretary of state at Albany that it has increased its capital stock from $4,000,000 to $5,000,000. The liabilities of the company are stated to be $431,000.

A certificate has been filed with the secretary of state stating that the Edison Electric Illuminating company of Brooklyn has increased its capital stock from $4,000,000 to $5,000,000. The liabilities of the company are placed at $2,312,118.

The North American company, which figured conspicuously in the Villard deals a few years ago, has made a report showing that its gross earnings last year amounted to $10,845 more than the previous year, and that its expenses were cut down $949 in the same period.

Dickinson MacAllister, receiver of the Metropolitan West Side Elevated Railroad company, in his monthly statement filed in the United States Circuit Court, showed that the receipts of the company during May were $345,361.34 and the disbursements were $86,799.01, leaving a cash balance of $258,562.33. The cash balance from April was $241,863.79. During May the railroad fares amounted to $99,410.50, while rentals and privileges produced $4,087.05.

TECHNICAL SCHOOLS.

At the Johns Hopkins University commencement last week certificates of proficiency in applied electricity were awarded to nine men.

Daniel W. Church, late of Rensselaer Polytechnic Institute, has been appointed professor of engineering in Lewis Institute, Chicago.

The graduating class of the Rensselaer Polytechnic Institute of Troy numbered 27. The degree of civil engineer was conferred upon 25, and two received the degree of bachelor of science. Three of the members of the class are in the war.

Princeton conferred the degree of electrical engineer on two members of the graduating class at the commencement on June 15th. Forty-six members of the class received the degree of bachelor of science and 13 the degree of civil engineer.

A class of 23 was graduated at the Rose Polytechnic Institute of Terre Haute, Ind.—18 in electrical engineering, four in civil engineering and one in chemistry. The Hemenway gold medal for the highest standing in the graduating class for the four years went to Henry Stilz of Louisville.

MISCELLANEOUS.

The Canadian Electrical News for June contains several interesting articles on general topics and considerable convention matter. It is a very creditable number.

TRADE NEWS.

Mr Henry A. Coit has taken charge of the southern office of the Sterling Electric company of Chicago, with headquarters in the Laclede building, St. Louis. In addition to exploiting the products of the Sterling company, Mr. Coit will handle high-grade telephones and line supplies, including everything used in the equipment and maintenance of a telephone exchange and toll line.

Kurz & Root, consulting electrical engineers of Appleton, Wis., have recently added an electrical repair shop to their factory, and are now prepared to make repairs, such as rewinding armatures, fields, transformers, repairing and standardizing burned-out or defective electrical instruments. They are also prepared to send electrical experts to examine any part of their customers' plants or make repairs in the stations.

The Goubert Manufacturing company, 14 and 16 Church street, New York, has secured from the Metropolitan Street railway company of that city the contract for feed-water heaters for the mammoth power station being erected at Ninety-sixth street and East River. The first installment consists of 30,000 horse power in six heaters, horizontal type, and rated at 5,000 horse power each. They are to be placed between the low-pressure cylinders and the condensers. This contract is said to cover the largest single order for feed-water heaters ever placed in this or any other country.

The annual meeting of the stockholders of the Siemens & Halske Electric company of America was held on Thursday, June 16th, at the office in Chicago. Nearly the entire capital of the company was represented at the meeting, and the following-named gentlemen were elected directors of the company: Charles T. Yerkes, Martin Maloney, John R. Bartlett, R. Suydam Grant, Charles E. Yerkes, E. A. Moore, B. W. Grist, Howland Coit, W. L. Elkins, Jr. The new board of directors was organized, and officers were elected as follows: President, Charles E. Yerkes; secretary and treasurer, W. T. Block; assistant secretary and assistant treasurer, C. F. Marlow; general manager, B. W. Grist. The following-named gentlemen compose the executive committee: Martin Maloney, Charles E. Yerkes, J. R. Bartlett.

An important combination in the rheostat business has just been consummated by the consolidation of the Cutler-Hammer Manufacturing company of Chicago with the American Rheostat company of Milwaukee, both companies being well known to the electrical trade. The business will be carried on under the name of the Cutler-Hammer Manufacturing company at 70-80 West Jackson street, Chicago. The capital stock of the combined company has been increased to $75,000, and a large proportion of the increase has been invested in new machinery. With its increased manufacturing facilities and larger capitalization the company will be able to take care of its rapidly increasing business in a prompt and satisfactory manner. The officers of the new company are as follows: President, F. R. Bacon; vice-president, F. L. Pierce; secretary and treasurer, J. G. Hickcox; electrical engineer and general manager, H. H. Cutler.

The Diehl Manufacturing company of Elizabethport, N. Y., makes this announcement to the trade: "Our policy has always been, and still is, not to trouble the public with patent litigation so long as it could possibly be avoided. Certain manufacturers have, however, taken advantage of this policy by offering electric fans which, we are advised, infringe so many of our patents that we are bound to enforce our rights. Accordingly, we have commenced suit against Rice & Marean of Washington, under the following patents: No. 465,360, dated December 15, 1891; No. 465,361, dated December 15, 1891; No. 537,679, dated April 16, 1895; No. 585,250, dated June 29, 1897. As soon as these patents are judicially sustained, we will proceed against all dealers in and users of infringing fans for damages and injunction. We believe it our duty to the public to give publicity to the above facts, so that no one shall unknowingly run up a bill of damages, and so that everyone who does not wish to do so may be on his guard against becoming an infringer."

BUSINESS.

A neat booklet calls attention to the merits of the Wurts lightning arresters. It is issued by the Westinghouse Electric and Manufacturing company of Pittsburg, which will send additional information on request.

The Western Electric company desires to advise the central stations using alternating current apparatus that it will be pleased to quote prices on the Lakon transformers and Lakon cut-outs for transformers.

The Peerless Rubber Manufacturing company of 16 Warren street, New York, and 202 South Water street, Chicago, claims that its Rainbow and "Honest John" steam packing is unequaled. A number of flattering testimonials seem to bear out the statement.

The installation of chloride accumulators in the electric-lighting plant at the residence of John A. Brown, Jr., Esq., near Wayne, Pa., forms the subject of a recent circular issued by the Electric Storage Battery company of Philadelphia. Several illustrations supplement the text.

The Warren-Medbery company of Sandy Hill, N. Y., manufacturer of inductor alternators, reports a flattering demand for its machines. The strong points of the Warren-Medbery apparatus are becoming widely known, and the company has installed a number of machines during the last two weeks.

ILLUSTRATED ELECTRICAL PATENT RECORD.

Issued June 14, 1898.

605,478. Automatic Stop Mechanism for Printing Presses. George Gibbs, Milwaukee, Wis., and Irving Stone, Chicago, Ill. Application filed June 12, 1897.

The mechanism is adapted to operate upon a continuous web or strip of material [illegible] feeding the [illegible] stopping device, a magnet for operating said stopping device, having [illegible] connected with a source of current, a circuit controller normally closed and short circuiting the magnet, and a movable device normally supported by the web or strip and arranged when ever the web or strip is severed or slackened to open the circuit controller and thus cause the magnet to be energized.

605,485. Brake for Trolley Cars. Aloysius H. Klingler, Ridley Park, Pa. Application filed February 20, 1897.

A combined brake and fender is provided comprising standards adapted to be [illegible] a car-truck frame and having slots of different radii [illegible] the upper and lower portions thereof, brake shoes provided with cross bars to [illegible] and the shoes having grooves or recesses in the walls of the same of different radii as to the upper and lower portions thereof, pins carried by the shoes and standards for engaging and moving in the slots and grooves respectively of the standards and shoes and means for actuating the brake shoes in the slots of the standards.

605,498. Incandescent Electric Lamp. Otto H. Michaelson, Charleston, W. Va. Application filed July 17, 1897.

A base of insulating material having an [illegible] groove in its outer end, a metal shell in which the [illegible]

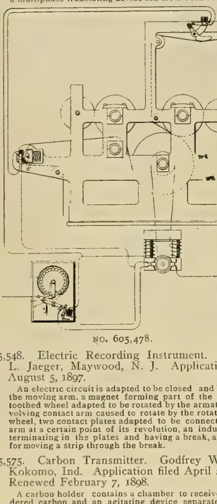
secured, conductor wires extended through the base piece, a ring of insulating material in the shell, a metal ring on the insulating ring and with which one of the wires connects, a metal ring in the insulating ring and with which the other wire connects, a globe having a channel around the wall of its open end, and a packing ring engaging the channel and in the groove of the base.

605,525. System of Electrical Distribution. Charles P. Steinmetz, Schenectady, N. Y. Application filed January 28, 1895.

A dynamo-electric machine is utilized having out-of-phase coils connected to three collector rings, and the remaining terminal of one coil connected to an intermediate point in the second coil, and a fourth collector ring likewise connected to the intermediate point in the last-named coil.

605,526. System of Electrical Distribution. Charles P. Steinmetz, Schenectady, N. Y. Application filed June 17, 1897.

The arrangement includes a generator having a main coil and a supplemental coil at an angle thereto connected at one end to an intermediate point in the main coil, a three-wire distribution system fed from the main coil, and a multiphase translating device fed from both coils.



NO. 605,478.

605,548. Electric Recording Instrument. Charles L. Jaeger, Maywood, N. J. Application filed August 5, 1897.

An electric circuit is adapted to be closed and broken by the moving arm, a magnet forming part of the circuit, a toothed wheel adapted to be rotated by the armature, a revolving contact arm caused to rotate by the rotation of the wheel, two contact plates adapted to be connected by the arm at a certain point of its revolution, an induction coil terminating in the plates and having a break, and means for moving a strip through the break.

605,575. Carbon Transmitter. Godfrey W. Goss, Kokomo, Ind. Application filed April 20, 1897. Renewed February 7, 1898.

A carbon holder contains a chamber to receive the powdered carbon, and an agitating device separate from the carbon holder is arranged within the chamber thereof for agitating the powdered carbon in the chamber, independently of any movement of the carbon holder.

605,580. Telephone Circuit and Apparatus. Milo G. Kellogg, Chicago, Ill. Application filed March 23, 1887.

A metallic circuit between two stations includes the secondary coils of two translators, one at each station, each translator containing a core and a primary coil and a secondary coil each wound around the core, each secondary coil having two parts and having its inductive center determined, and each point or portion of each part having a corresponding point or portion in the other part, which pairs of points or portions are equivalently in the same position with relation to every point or portion of the core, in combination with another circuit into which the metallic circuit is connected at the two inductive centers of the translators.

605,592. Letter box. Miletus J. Wine and Charles A. Thompson, Washington, D. C. Application filed April 17, 1897.

A signal-box is located adjacent to the letter-box; a hinged lid on the letter-box is provided with an arm, and a door on the letter box is provided with an arm and an electrical circuit, oppositely disposed electro-magnets in the circuit within the signal-box, a pivotally supported armature, a [illegible] arranged to contact with the poles of the magnet and engage the signal with its free end to move the signal into and out of sight, and contacts in the circuit within the letter-box in the path of the arms on the lid and door thereof to make and break the circuit.

605,594. Telephone Receiver. Peter C. Burns, Chicago, Ill. Application filed November 20, 1897.

The instrument comprises a permanent magnet, a collar mounted thereon, a diaphragm cap, a diaphragm and a cup-shaped member to which the diaphragm and cap are secured, and a screw connection between the cup-shaped member and the collar whereby the diaphragm may be adjusted in proper position relative to the pole piece, together with a disk on the collar and stop screws in the disk adapted to bear against the cup-shaped member and lock the parts in adjusted position.

605,615. Ore Stamp. David M. Smyth, Pasadena, Cal. Application filed Jun[illegible] 1897.

The combination [illegible] and the electromagnets for actuating the [illegible] that is actuated by an upward movement [illegible] stamp to change the circuit connection for [illegible] stamp.

605,631. Electrically Driven and Moved Plow. Erich Dallmann, Neu[illegible]dz, Germany. Application filed October 9, 1897.

Shafts are arranged behind each other driving a plurality of conical plow [illegible] frames, pendulously suspended at those shafts and coupled by guide-bars, plow-screws at the lower end of driving shafts, the latter being lodged at the frames in such a manner as to be prevented from coaxial shifting and means for adjusting and securing the frames.

605,659. Automatic Apparatus for Telephone Switchboards. Julius H. West, Berlin, Germany. Application filed July 8, 1896.

An automatic switch apparatus for telephone exchanges consists of the combination with the plug or connection cords, the operator's telephone and the call battery, of a number of contacts inserted in the connecting cords, a shaft continuously rotated by a suitable motor, disks loosely mounted on the shaft and having suitable cam surfaces, means for coupling the disks with the shaft automatically by the action of lifting up the connection plug, and means for operating the contacts by the rotation of the disks.

605,661. Insulating Electrodes for Electric Gas-lighting Burners. Adrian L. Bogart, Jamaica, N. Y. Application filed May 5, 1897.

One of the electrodes is formed of a metal wire or strip and there is an insulating shield through which the wire or strip is threaded.

605,663. Electric Railway. Charles H. Davis, New York, N. Y. Application filed November 2, 1897.

A line is divided into insulated divisions; signal devices are respectively located between the successive divisions; means are provided for actuating the signal devices successively to give a definite indication, and means are also provided controlled by each signal device for then establishing electrical circuit in the line divisions between which it is located.

605,664. Combined Train-arresting and Signaling Mechanism for Electric Railways. Charles H. Davis, New York, N. Y. Application filed November 9, 1897.

The combination is described in an electric railway of a line conductor and an electric motor vehicle, a contact arm on the vehicle normally closing circuit between the vehicle motor and the line conductor, and a brake mechanism on the vehicle controlled by the arm; the aforesaid parts being constructed and arranged so that when circuit is open between the contact arm and the conductor the brake mechanism shall be controlled thereby to arrest the motion of the vehicle.

605,665. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed August 6, 1897. Renewed May 18, 1898.

An electric meter is provided with an annular armature, coils exterior to the armature connected in circuit, a cross-shaped magnetic core within the armature, coils on two poles of the core, also connected in circuit and closed circuits on the other poles of the core.

605,670. Telephone-switchboard System. Fred C. Hughes, Detroit, Mich. Application filed July 3, 1897.

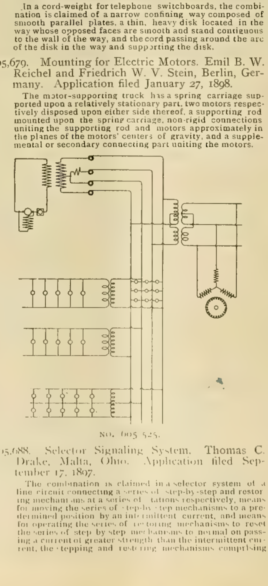
The supporting rod is common to all of the springs of the jack, an insulating covering upon the rod flattened upon one face, a series of springs mounted upon the insulating covering having an aperture therein provided with a straight face which coincides with the flat portion of the insulating covering, a series of insulating collars mounted upon the insulating covering of the rod and interposed between the springs, and the nuts on the ends of the rod for binding the parts together.

605,671. Cord Weight for Telephone Switchboards. Fred C. Hughes, Detroit, Mich. Application filed September 27, 1897.

In a cord-weight for telephone switchboards, the combination is claimed of a narrow confining way composed of smooth parallel plates, a thin, heavy disk located in the way whose opposed faces are smooth and stand contiguous to the wall of the way, and the cord passing around the arc of the disk in the way and supporting the disk.

605,679. Mounting for Electric Motors. Emil B. W. Reichel and Friedrich W. V. Stein, Berlin, Germany. Application filed January 27, 1898.

The motor-supporting truck has a spring carriage supported upon a relatively stationary part, two motors respectively disposed upon either side thereof, a supporting rod mounted upon the spring carriage, non-rigid connections uniting the supporting rod and motors approximately in the planes of the motors' centers of gravity, and a supplemental or secondary connecting part uniting the motors.



NO. 605,525.

605,688. Selector Signaling System. Thomas C. Drake, Malta, Ohio. Application filed September 17, 1807.

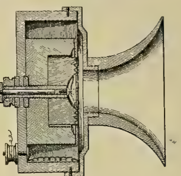
The combination is claimed in a selector system of a line circuit connecting a series of step-by-step and restoring mechanisms at a series of stations respectively, means for moving the series of step-by-step mechanisms to a predetermined position by an intermittent current, and means for operating the series of restoring mechanisms to reset the series of step by step mechanisms to normal on passing a current of greater strength than the intermittent current, the stepping and restoring mechanisms comprising electromagnets, connected in the line circuit whereby the diminished current may operate the ratchet wheel, lever and pawls to rotate the contact disk, and the normal current may operate the bifurcated lever to disengage the pawls respectively, the contact disk and contact screw to close a signaling circuit at a predetermined position of rotation of the series of mechanisms, and the segment gear to return the ratchet wheel and contact-disk to normal position on operating the restoring mechanism to reset the system.

605,695. Secondary Battery. Camille Brault, Paris, France. Application filed December 28, 1896. Patented in France August 14, 1895; in Belgium, January 10, 1896; in England, January 10, 1896, and in Switzerland, January 10, 1896.

One claim is given: In an electric accumulator, or storage battery, the combination with a body of active material of an inclosing fabric of asbestos, an outer covering or inclosure of perforated neutral material and cross rods, or bars, lying in openings in the active material, their ends being connected to the neutral plates by a solvent of the material of which said plates are composed.

605,714. Electric Arc Lamp. Daniel Higham, Boston, Mass. Application filed October 26, 1897.

The method is described of preventing excessive variations in consumption of two or more sets of electrodes connected in series and supplied from a direct current constant-potential source, the mode consisting of extinguishing the current by opening the circuit, then bringing the points of the two or more sets of electrodes to contact, to re-establish the current, and then separating the points of the two or more sets of electrodes an approximately equal distance apart.



NO. 605,575

605,741. Strain Insulator. Louis McCarthy, Boston, Mass. Application filed January 18, 1898.

A strain insulator comprising metallic portions separated from each other by interposed insulating material, a coupling member connected with a projecting part of one of the metallic portions outside of the insulating material by a swivel joint, and a connector having an adjustable screw-threaded union with the coupling member.

605,765. Apparatus for Supplying or Measuring Currents of Electricity. William D. Watson and Thomas Humphreys, Rochdale, England. Application filed December 28, 1897.

Mechanism for supplying and measuring electricity, consisting of primary clockwork, auxiliary clockwork, a governing lever actuated by the primary clockwork and controlling the escapement of the auxiliary clockwork, in combination with a cut-out device actuated by the auxiliary clockwork, and a device (controlled by the strength of the current used) whereby the governing lever remains inactive when no current is being used and allows the escapement to work quickly or slowly according as a greater or less amount of current is being used.

605,798. Electric Railway Signal. Charles L. Renrew, East Windsor, Conn. Application filed March 2, 1897.

A circuit breaker comprising a movable member, two conducting surfaces on the movable member insulated from each other, a non-conducting surface adjacent each conducting surface and out of line with each other, brushes bearing on each of the conducting surfaces out of the path of the non-conducting surface, and brushes bearing on the conducting surfaces and in the path of the non-conducting surfaces.

605,814. Electric-railway System. Henry A. Chase, Boston, Mass. Application filed February 7, 1891.

An electric-railway system, comprehending the following instrumentalities, is described: A conduit having a slot chamber; a conductor and guide having conducting and guiding surfaces located in the slot chamber and in line vertically with the slot of the slot chamber, independent tie-bars to connect the surfaces at intervals, and insulated arms to support the tie-bars, and a trolley frame, and a trolley made as a wheel, free to roll on the conductor.

605,824. Electric Railway. Rudolph M. Hunter, Philadelphia, Pa. Application filed December 14, 1897.

The combination is claimed of a car or vehicle, one or more electric motors to propel the car or vehicle, a speed controller for varying the speed of the motors, an air-brake apparatus for arresting the momentum of the car or vehicle, a pneumatic device for operating the controller under a pressure in excess of that necessary for the air brake, a common source of air supply, and means to vary the pressure of the air supply whereby the motors are cut out of operation as propelling motors when the air brake is applied.

605,832. Telephone Transmitter. William E. Sundberg, Worcester, Mass. Application filed September 28, 1897.

The claim is given: In a telephone transmitter, the combination of a casing having a mouthpiece, a metallic diaphragm, a plurality of screws having springs adjustably coiled thereon for holding the diaphragm in place, a contact plate carried by said diaphragm, a diaphragm, a contact plate secured thereon, a central adjusting screw having nuts for regulating the distance between said contact plates, a body of powdered carbon confined between the contact plates, and a felt washer secured on the contact plate in position to confine the body of powdered carbon, and to engage an inclined or chamfered edge on the contact plate.

MAIN OFFICE AND FACTORY, SYRACUSE, NEW YORK.

NEW YORK OFFICE: 39-41 CORTLANDT STREET, NEW YORK CITY.

A WARNING To Users and Purchasers of KEYSTONE INSTRUMENTS.

We have recently learned that an unscrupulous contracting and manufacturing concern is supplying their trade with alleged modern "Keystone Instruments," which are in reality old Instruments made by us years ago and purchased by them at second hand, they changing them in range and character to meet the requirements of their orders. These old Instruments are lacking in many of the improvements which make our modern line so desirable, and in addition have been botched in the change by lack of knowledge and facilities.

In view of this we desire to inform the public that every Instrument shipped from our factory is accompanied by a certificate duly signed, giving the serial number of the Instrument, its range and date of calibration.

We would warn the public to accept no Keystone Instruments unless accompanied by such a certificate.

Keystone Electrical Instrument Co.,

NINTH ST. AND MONTGOMERY AVE., PHILADELPHIA.

NEW YORK. BOSTON. CHICAGO.

THE BEST IS ALWAYS THE CHEAPEST.

Gold Medal Commutator Compound.

THE OLDEST, BEST AND CHEAPEST COMPOUND MANUFACTURED.

It saves your Commutator.

Absolutely prevents sparking and cutting of the Commutator. Never Gums the Brushes. Endorsed by the U. S. Government and thousands of customers. We guarantee it superior to any manufactured or money refunded.

Price, $4.20 per dozen Sticks. **Send for Free Sample.**

A trial will convince you of its merits. Once used you will have no other.

Sole Manufacturers,

A TECHNICAL EDUCATION 50 CENTS A WEEK.

The new installment plan of The International Correspondence Schools, Scranton, Pa.—the largest and most successful institution teaching technical subjects by mail—places an education within the reach of all. Students may enroll upon paying $2 in advance, the balance to be paid at the rate of $2 a month. The charges are moderate and include all necessary text-books. Studies are carried on at home without loss of time from work.

The Electrical Power and Lighting Scholarship is a thorough course of instruction in the installation, care and operation of electric light, power and railway plants designed to meet the wants of busy men who wish to put into actual practice as soon as possible the information they acquire.

Also 80 courses including Steam Engineering, Mechanical Drawing, Machine Design, Civil Engineering, Bookkeeping, Shorthand and English branches.

Write for circular, stating subject in which you are interested.

THE INTERNATIONAL CORRESPONDENCE SCHOOLS, BOX 1002, SCRANTON, PA.

ELECTRICIAN PUBLISHING CO.,
Suite 510 Marquette Bldg., CHICAGO

Combination "Hot Blast" Blow Torch

(FOR GASOLINE.)

(PATENTED.)

New and Powerful Generator,

Three useful tools in one, viz.: Paint burner, plumbers' and electricians' torch and soldering-iron heater. Soldering-iron attachment is a most valuable feature. Generates blue flame 1,500° Fahrenheit. Will not blow out.

White Mfg. Co., 158 INDIANA ST., CHICAGO.
Eastern Branch: 115 Baker Ave., Syracuse, N. Y.

No. 3397

Be On Time.

DO NOT LET

Jack Frost Stop Your Cars!

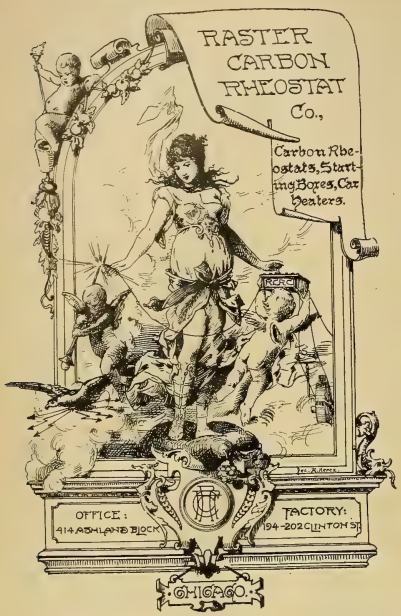
No. 3397.

This is the time of year when sleet gathers on the trolley wire. Sleet may not interfere with the operation of your cars or you may have means of clearing the wire.

We have a way to clear the wire of sleet by means of a **SLEET WHEEL.** This wheel is No. 3397 in our catalogue and the list price is $1.75 each. The design is a development resulting from experiments with a number of **SLEET WHEELS.** It will remove the sleet from the line without damaging any part of it and does not catch in an ear, frog or crossing.

If this interests you we would like to receive your order for one or more sleet wheels and would be pleased to quote you prices.

WESTERN ELECTRIC COMPANY,
CHICAGO. NEW YORK.



Carbon Rheostats, Carbon Starting Boxes, Carbon Car Heaters, Carbon Resistances

FOR ALL PURPOSES.

Cannot burn out when overloaded.

Allow the selection of larger cross sections.

The only resistances not subjected to induction currents, and therefore the only practical instruments, excepting lampboard rheostats, for tests with alternating dynamos.

Retain an almost equal resistance whether hot or cold. In other words, not subjected to any outside influences whatsoever.

Starting boxes safely permit a continuous current of two minutes and more, and are tested with an overload of 25 per cent.

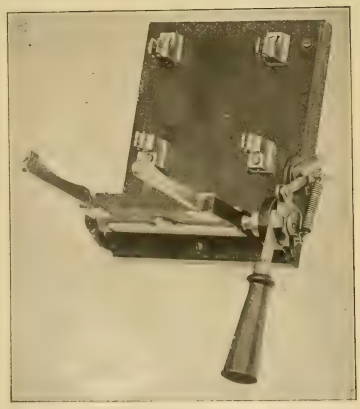
Inquiries, investigations and severest tests invited.

Send for descriptive circular and price lists.

Raster Carbon Rheostat Co.,

Office, 414 Ashland Block,
Factory, 194-202 Clinton St., CHICAGO.

A Word to the Wise.



ANY VOLTAGE.

Extract from the Rules and Requirements of the National Board of Fire Underwriters.

SWITCHES:

RULE 43. SEC. E. Must, for constant potential systems, operate successfully at fifty per cent. overload in amperes, with twenty-five per cent. excess voltage under the most severe conditions they are liable to meet with in practice.

SEC. F. Must, for constant potential systems, have a firm and secure contact; must **make and break** readily, and not **stop** when motion has once been imparted by the handle.

We are the Only Switch Makers Who Fully Comply with the Above Rules.

Hope Electric Appliance Co.,

Providence, R. I.

New Catalogue Sent Upon Application.

AD STUDIO
COMMERCIAL ELECTRICAL SUPPLY CO. ST. LOUIS

A "Candle" may be a "Candle"—
and all that—
But some are made of beeswax,
and some are made of fat!

The above is merely a homely way of telling you that some arc lamps are a great deal better than others. Following are some most excellent reasons why the Jandus Arc Lamp is the best. These reasons are quoted bodily from the report of the Franklin Institute awarding to Wm. Jandus, patentee of the Jandus Enclosed Arc Lamp, the John Scott medal:

"The practical advantages of this lamp are:

"First.—That it can be used singly between mains of any ordinary direct incandescent circuit with comparatively little waste of energy.

"Second.—That the life of the carbons being so long, the lamp requires trimming only at long intervals; after certainly not less than 150 hours, thus showing a great economy in labor and carbons, this being about twenty times the life of a carbon in arc lamps now generally in use.

"Third.—The construction of the lamp is of an extremely simple character, with no complication of parts and with little liability to get out of order.

"In view of these facts, the Franklin Institute recommends the award of the John Scott Legacy Premium and Medal to William Jandus for his improved arc lamp adapted to incandescent circuits.

"Adopted at the stated meeting of the Committee on Science and the Arts, held Wednesday, May 1, 1895.

"(Signed) Jos. M. Wilson, President.
Wm. H. Wahl, Secretary.
"(Countersigned) Samuel Sartain, Chairman."

THE

Standard "Jandus"

150 Hour Enclosed
Arc Lamp,
Inside Service.

Constant Potential,
Constant Current,
Alternating,
220 Volt,
Railway
Short Types.

Mechanically and electrically without an equal.

Used by more than 150 Central Stations.

Prospective buyers of Arc Lamps should bear in mind the following important facts:

The standard "Jandus" 150 hour arc lamp is the same as that formerly sold as the "Manhattan." The Jandus Electric Co. is the **sole owner** of the patents of William Jandus and the **sole manufacturer** of the 150 hour enclosed arc lamps made under these patents and heretofore sold as "Manhattan."

The "Jandus Electric Co." is the **sole selling agent** for the "Jandus" (formerly known as the Manhattan) 150 hour arc lamp.

Address all inquiries regarding the "Jandus" (formerly known as the "Manhattan") 150 hour enclosed arc lamp, to our Cleveland or Chicago office. Catalog on

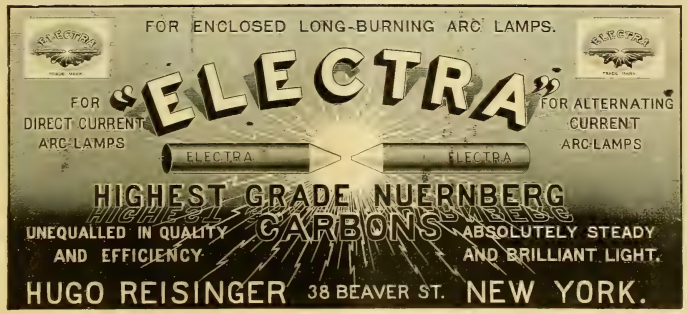
The Jandus Electric Co.

Chicago Office: 753 Monadnock Building. Factory: Cleveland, Ohio.

CARBONS!

An Even and Perfect Combination and an Excellent, Uniform, Brilliant and Steady Light. . .

CAN BE OBTAINED BY THE USE OF THE



NOTICE.

The "Electra" Highest Grade Nuernberg Carbons are manufactured, as heretofore, by the world-renowned firm of C. CONRADTY, Nuernberg, who owns not only the oldest but the largest Carbon works in existence.

See that every package of the "Electra" Carbons bears a label with my trademark "Electra," and thus avoid the use of inferior Carbons offered to you under the name "Electra."

Infringers of my trademark will be rigidly prosecuted to protect the interest of purchasers of my Carbons.

COLUMBIA LAMPS.

UNEQUALED IN QUALITY.

We claim Columbia Lamps to be the very highest in quality. The filaments are prepared in such a manner as to make them almost absolutely uniform, producing lamps that are uniform not only in voltage but in consumption of energy and candle power.

We are prepared to duplicate for those who buy lamps from us, lamps of exact type suited to their actual conditions.

Owing to the fact that these lamps show such a remarkable maintenance of candle power they should be ordered up to the full maximum voltage at which they are to be operated.

The lamps do not grow yellow with age and if properly operated will give the best satisfaction of any lamps made.

We challenge comparison.

The very high maintenance of candle power is ABSOLUTE PROOF of the EXCELLENT VACUUM.

A Great Railway

The Chicago, Milwaukee & St. Paul Railway company owns and operates 6,151 miles of road. It owns and operates its own Sleeping Cars and Dining Cars, and its service is first-class in every respect. It traverses the best portion of the States of Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota. It runs vestibuled, electric-lighted trains between Chicago, St. Paul and Minneapolis, and between Chicago and Omaha and Sioux City, and solid trains between Chicago and Kansas City. Also through sleeping cars and coaches between St. Louis and Kansas City and St. Paul and Minneapolis, daily, via the Hedrick Route. It has the absolute block system. It uses all modern appliances for the comfort and safety of its patrons. Its train employes are civil and obliging, and its General Passenger Agent asks every man, woman and child to buy tickets over the Chicago, Milwaukee & St. Paul Railway for it is A Great Railway.

Map of the United States.

A large handsome Map of the United States, mounted and suitable for office or home use, is issued by the Burlington Route. Copies will be mailed to any address on receipt of fifteen cents in postage by P. S. EUSTIS, Gen'l Pass Agent, C., B. & Q. R. R., Chicago, Ill.

Telephone..Service

CHICAGO TELEPHONE COMPANY.

PRIVATE

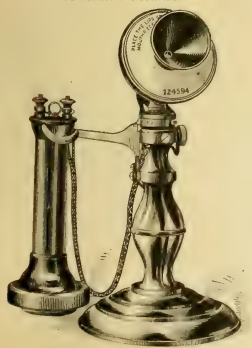
BRANCH EXCHANGE SWITCH BOARD

Placed in the premises of the subscriber and connected by TRUNK LINES with the exchanges of the

CHICAGO TELEPHONE COMPANY.

Direct lines are extended from these switch boards to the various offices or departments of the subscriber and connections between them or with the telephone exchange are controlled by the operator in the subscriber's office.

Extension Desk Set.



Base, 6 inches in Diameter.

We now furnish Telephone Service to more than twenty thousand patrons in Chicago and vicinity.

The requirements of sixteen thousand subscribers are provided for in the service of the Chicago Telephone Exchange and amount to more than two hundred and twenty thousand (220,000) calls each day. This volume of telephone traffic, unequalled in any other city in the world, is an assurance of the satisfactory character of the service.

The proper number and arrangement of telephones in a place of business is just as important as the number of desks, or disposition of entrances, or arrangements for receiving or shipping goods. Telephones properly placed and handled in your establishment will save time and money.

We have now more than fifteen different arrangements of telephones, including long-distance equipments, desk telephones always within reach of your right hand, private branch exchanges, etc., which will in proper combination and arrangement, meet the requirements of any business.

Service in private residences is offered at rates from $100 to $60 per year. The four party line service (16c per day) is giving satisfaction to over one thousand subscribers.

Rates at suburban points are from $18 to $60 per annum according to the class of service desired. All Exchanges of the Chicago Company are operated in connection with the Long Distance lines of the American Telephone and Telegraph Company, reaching every important city and town in the United States from Omaha to Boston.

We shall be glad to consider with you the matter of your telephone service.

FOR BUSY MEN.

HART SWITCHES are built for busy, practical men—men to whom time means money and reputation is capital.

HART SWITCHES are built for active service. They are easily installed. They last after they are installed.

HART SWITCHES are cheapest because they last longest, thus saving not only the cost of new switches but the cost of repairs and annoyance of complaints.

HART SWITCHES are built for experienced men. If we were building for inexperienced or careless buyers and depending on "catch-trade," it would be an easy matter to "skimp" material and quality of work and put our switches on the market by "bargain counter" methods.

We believe it is better and more profitable to sell one customer a hundred times than a hundred customers once. We therefore make the best switches we know how. One sale results in many more to the same purchaser.

Our aim is to interest you sufficiently to cause you to examine our switches. We are certain of your approval.

All leading supply houses carry Hart Switches in stock. Make your next order read "Hart" Switches and you will be well pleased with value received.

Write for Catalogue "C."

WE ALSO MANUFACTURE A COMPLETE LINE OF DETACHED ENGINES, DYNAMOS AND MOTORS.

AMERICAN ENGINE CO.,

No. 28 Raritan Avenue, Bound Brook, N. J.

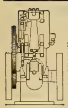
Features of Our Engines Worth Remembering:

1st—A symmetrical design with an intelligent, scientific distribution of metal, giving exceptional strength and perfect balance.
2nd—The only absolutely steam-tight valve, which automatically adjusts itself for wear, needing no outside attention.
3rd—"Rites governor system," which combines the greatest simplicity with most perfect regulation.
4th—Crank shaft forged open-hearth high-carbon steel, combining greatest strength, best wearing qualities and smoothest surface.
5th—Most complete automatic oiling system.

THE BALL ENGINE CO.,

Chicago Office, 1526 Monadnock Block. ERIE, PENNSYLVANIA, U. S. A.

FOOS Gas and Gasoline Engines EXCEL ALL OTHERS IN DESIRABLE FEATURES.
Adapted for ALL Power Purposes—Electric Lighting, Milling, Mining, Water Works, Elevators, Factories, etc. Cheaper and Better than Steam.
2 to 250 H. P. Write Before Purchasing. FOOS GAS ENGINE CO., Springfield, O.



PROUTY
Electro-Gasoline Engine
2 to 50 H. P.
Runs without smoke, odor or noise. Special styles for Electric Lighting, Boats, Mining Locomotives, Hoists, Portable, Threshing, Pumping, Farm and Dairies, Inspection and Street Cars, Road-Wagons, Printing Offices and all stationary purposes. All engines guaranteed and may be returned at our expense if not as represented. THE PROUTY CO., 79 Dearborn St., CHICAGO, U.S.A.

—THE—
Clonbrock Steam Boiler Co.,
BROOKLYN, N. Y.
Manufacturers of the
Morrin "Climax" and "Compound" Safety Water Tube Boilers.
BUILT IN UNITS OF 50 TO 1,000 H. P.
CAUTION: Beware of infringers, they will be rigidly prosecuted.
ALSO BUILDERS OF
Smoke Stacks, Tanks, Etc., and All Classes of Iron Work.
Specifications, Drawings and Prices furnished on application.
Send for Catalogue of Climax and Compound Boilers.

ELECTRICITY AND MAGNETISM.

325 PAGES. PRICE $2.00. 347 ILLUSTRATIONS. A series of Thirty-four Practical Lessons covering the Science of Electricity from Its Fundamental Principles to Its Every-day Applications. By Prof. D. C. Jackson, University of Wisconsin; Prof. H. S. Carhart, University of Michigan; Prof. B. F. Thomas, University of Ohio; Prof. Wm. A. Anthony, of New York; Prof. Brown Ayres, Tulane University; Prof. A. C. Perrine, Leland Stanford University, Cal.; Prof. Geo. D. Shephardson, University of Minnesota, and others. A Comprehensive Treatise in Simple Language, Free from Algebraic Equations and Easily Understood.

CONTENTS:

CHAPTER I: The Nature and Properties of Electricity; Origin of Electricity; Two Kinds; Laws of Attraction and Repulsion; Positive and Negative Charge; Terms, Conductors, Insulators, Electric Conductivity; Conveying Electricity; The Electroscope; Force Exerted Between Charged Bodies; Unit of Measurement of quantity of Electricity; Electrometer.—CHAPTER II: Machines for Generating Electricity by Friction and by Electric Induction; Making Machine to Continuously Generate Electricity by Friction; The Electrophorus; Induction Generator; Units of Electric Current and Pressure; Electricity Conveyed by Unit Current Each Second; Negatively and Positively Charged Conductors; Relation of Lightning and Sparks of Electrical Machine.—CHAPTER III: Electric Batteries or Appliances for Generating Electricity by Chemical Action; Action of Batteries; Electric Pressure; Voltaic Electricity; Direction of Current Flow; Production of Continuous Current; Battery Cells in Series; Production of Pressure by Cells; Polarization and Its Avoidance; Leclanche Cell; Open Circuit Cells.—CHAPTER IV: Electric Batteries or Appliances for Generating Electricity by Chemical Action (Concluded); Closed Circuit Cells; Local Action; Law of Electro-chemical Action; Electro-chemical Equivalent; Primary Batteries Compared with Dynamos for Furnishing Current; Uses of Batteries; Difference Between a Primary and Storage Battery; How Storage Batteries are Made; Parallel Connection of Plates in Storage Batteries.—CHAPTER V: The Nature and Properties of Magnetism, Magnetic Fields; Permanent Magnetism; Magnetic Attraction and Repulsion; Poles of Magnet; Magnitude of Force Between Two Magnets; Aging Magnets; Earth's Action on Magnetic Needle; Magnetic Field; Action of Lines of Force.—CHAPTER VI: The Magnetic Effects of Electric Currents and Magnetic Circuits; Effect of Electric Current on Magnetic Needle; Relation Between Direction of Lines of Force and Direction of Current Flow; Determination of Current Direction by Compass; Ampere Turns; Solenoids; Ampere's Theory; Solenoids with Steel or Iron Cores; Residual Magnetism; Electro-Magnets; Magnetic Permeability; Magnetic Reluctance; Magneto Motive Force or Magnetic Pressure.—CHAPTER VII: Ohm's Law of the Flow of Electricity; Pressure; Resistance; Current; Volt; Ohm; Ampere; Mercury Resistance; Conductivity of Copper Compared with Other Metals; Resistance of Circuits Made Up of the Same Parts in Parallel; Joint Resistances; Fall of Voltage Over Resistance; Effect of Temperature on Resistance; Copper Temperature Coefficient.—CHAPTER VIII: Heating Effects of Electric Currents; Miscellaneous Effects of Electric Currents; Foot-pound; Joule; Horse-power; Watt; Kilowatt; Watts per Horse-power; Heating Effects on Bearings of Machinery; Effect of Electricity on Nerves of Animals; Muscular Effect of Strong Currents. CHAPTER IX: Galvanometers and Voltameters, Differences in Construction for Large and Small Currents; Presence and Direction of Currents Shown by Galvanometers; Strength of Current Indicated; Tangent Galvanometer; Reflecting Galvanometer; Needle Suspension; d'Arsonval Galvanometer; Terms "Dead-Beat," "Calibrate," Voltameter; Electrolyte, Electrolysis; Electrode; Forms of Voltameters.—CHAPTER X: Measurement of Electrical Resistance; Resistance Measured by Substitution; Resistance Boxes; Use of German Silver; Coils; Wheatstone Bridge; Measuring Resistances with Bridge; Measuring Very High Resistances; Practical Examples.—CHAPTER XI: Every-day Measurements of Electric Currents and Pressure; Three Effects by Which Currents are Directly Measured; Amperemeters; Milliampere; Microampere; Three Classes of Magnetic Amperemeters; Weston Amperemeter; Electro Dynamometers; Hot Wire Instruments; Scales of Amperemeters; Alternating Current Measuring Instruments; Measuring Very Large Currents; Measuring Electric Pressures; Voltmeters; Cardew Voltmeter; Electrometers; Electrostatic Voltmeters; Standard Cells; Measuring Currents by Voltmeter and a Standard Resistance.—CHAPTER XII: Every-day Measurements of Electric Power, Condensers and The Measurement of their Capacity; Wattmeters; Electrodynamometer Used as Wattmeter; Recording Wattmeters; Coulomb Meters; Watt Hour; Ampere Hour; Capacity; Farad; Microfarad; Condenser; Capacity of Condenser; Charging Condenser; Specific Inductive Capacity; Selection of Insulation for Telephone Cables; Capacity of Underground Wires; Comparing Capacities by Ballistic Galvanometer; Practical Capacity Measurements; Leyden Jar.—CHAPTER XIII: Electrolytic Deposition of Metals; Electroplating; Metals Commonly used in Plating; Salt of a Metal; Nitrate of Silver; Cyanide of Silver and of Potassium; Solution for Silver plating; Vats; Quality of Electrolytic Deposit; Effect of Too Great or Small Currents; Cleaning Articles to be Plated; Gilding Inside of Silver Articles; Base Metals on Which Nickel is Usually Plated; Solution for Nickel Plating; Electrotyping; Electrotype Molds; Electrotype Finishing; Electrolytic Refining of Copper; Solution Used.—CHAPTER XIV: The Electric Telegraph; Elements of Electric Telegraph; Telegraph Circuits; Telegraphic Signals; Sending and Receiving; Telegraph Lines; Sounder; Relays; Local Circuits; Multiple Telegraphy; Duplex Telegraphy; Diplex Telegraphy; Quadruplex Telegraphy.—CHAPTER XV: Multiple Telegraphy; Differential Relay; Polarized Relay; Pole Changer; Principles of Operation of Diplex, Quadruplex, Bridge Duplex; Artificial Line; Autographic Telegraphy.—CHAPTER XVI: The Telephone; Bell Telephone; Microphone; Blake Transmitter; Exchanges; Switchboard; Long-Distance Transmitter.—CHAPTER XVII: The Construction of Telegraph and Telephone Lines and Instruments; Poles; Cross-Arms; Pins; Joints; Insulators; Insulation; Ground Plates; Underground Cables; Conduits; Fuses; Multiple Switchboards.—CHAPTER XVIII: Testing Lines for Insulation and Conductivity and the Location of Leaks and Breaks; Line Troubles; Grounds; Crosses; Locating Trouble; Earth Currents; Line Conductivity and Insulation; Testing.—CHAPTER XIX: Principles of Continuous Current Dynamos and Motors; Electric Conductor in Magnetic Field; Field Strength; Induced Electric Pressure; Direction of Current Moving Conductors; Alternating Current; Dynamos; Magnetos; Commutator.—CHAPTER XX: Principles of Continuous Current Dynamos and Motors; their Construction, Care and Attendance; Gramme Armature; Siemens Armature; Armature Current; Laminating Cores; Foucault or Eddy Currents; Hysteresis; Fundamental Principles of Dynamos and Motors; Points of Good Dynamo; Counter Electric Pressure; Types of Field Windings; Series, Shunt and Compound Wound Machines; Multipolar Machines; Regulation, Care and Maintenance.—CHAPTER XXI: Arc Lighting and Arc Light Machinery; The Arc; Arc Lamps; Principles of Operation; Connections; Arc Dynamos; Current and Pressure Required; Making of Arc Carbons; Regulators; Arc Light Switchboards.—CHAPTER XXII: Incandescent Lighting and Power Transmission, Two, Three and Five Wire Systems of Distribution for Electric Lights and Motors; Incandescent Lamp; Filaments; Vaccuum; Material for and Making of Filaments; Advantages of Incandescent Lamps; Incandescent and Motor Circuits; Constant Pressure; Loss of Voltage; Circular Mils; Practical Examples; Weight of Copper Required for Transmission of Power at Different Pressures; Three-Wire System; Motor Starting Resistances.—CHAPTER XXIII: Construction of Electric Light and Power Circuits, and Their Testing; Overhead Electric Light Wires; Weather-Proof Wire; Arc Circuit Wires; "Drawing In" and "Built In" Underground System; Underground Electric Light Cables; Edison Tubing; Feeders; Mains; Inside Wiring; Cleat Work; Moulding Work; Concealed Work; Dangers from Fires; Distribution System.—CHAPTER XXIV: Testing Electric Light Circuits and the Distribution and Measurement of Light; Faults; Soldered Joints; Magneto Bell; Use of Voltmeter to Locate Grounds on Arc Circuits; Ground Detector; General Testing; Photometer; Standard Candles; Illuminating Effect of Lamps; Effect of Opal Globes.—CHAPTER XXV: Electro-Magnetic Induction; Effect of Cutting Lines of Force by an Electric Conductor; Induced Currents; Induction Coils; Cores of Induction Coils; Transformers; Direction of Induced Current; Self Induction; Attraction and Repulsion of Parallel Wires Carrying Currents.—CHAPTER XXVI: Alternating Currents; Alternator; Electrolytic Effect of Pulsating Current; Heating Effect of Alternating Current; Effective Value; Alternating Current; Measurements; Frequency; Period; Apparent Resistance.—CHAPTER XXVII: Alternating Currents and Alternating Current Machinery (Concluded); Power Used in Alternating Circuits; Alternating Currents for Lighting; Making Transformers; Testing Transformers; Building Alternators; Number of Alternations; The Exciter; Running Alternators in Parallel; Synchronous Motors; Two-Phase and Three-Phase Systems; Induction Motors; Squirrel-Cage Armature; Mesh Connection; Star Connection.—CHAPTER XXVIII: Miscellaneous Applications of Electric Motors; Uses of Electric Motors; Motors in Machine Shops; Waste of Power in Factories; Advantages of Removing Shafts and Belts; Estimating Electrical Power Required; Electric Elevators; Electric Launches.—CHAPTER XXIX: Electric Railways; Richmond Electric Railroad; Trolley Wire; Trolley; Track; Use of Two Motors; Rail Bonds; Heavy Electric Locomotives.—CHAPTER XXX: Methods of Handling and Controlling Railway Motors and Generators; Output Records; Recording Voltmeters; Load of Electric Railway Plant; Application of Storage Batteries to Smooth Road Curve; Methods of Controlling Street Car Motors; Station Instruments; Equalizer.—CHAPTER XXXI: Model Electric Plant; First Central Station; Changes in General Mechanical Construction of Dynamos; Instruments; Multiple Arcing Galvanometers; Use of Double and Single Pole Switches; Operating Dynamos in Parallel; Feeder Connections in Continuous and Alternating Stations; Throwing Dynamo into Circuit; Cutting Dynamo Out.—CHAPTER XXXII: Underwriter's Rules, Etc.; Necessity of Rules; Special Points in Wiring; Insulation of Sockets, Fuses, Fixtures; Annunciator Wire; Office Wire; Leaky Wires.—CHAPTER XXXIII: Electric Welding, Forging, Etc.; Electricity Applied to the Kitchen; Electrical Methods Applied to Metal Working; Thomson Apparatus for Heating Metals; Welding by Thomson Method; Bernardos Process of Working Metals; Bringing Piece of Metal to High Temperature by Dipping in Pail of Water; Electric Current for Warming and Cooking; Electric Heating and Stoves Compared.—CHAPTER XXXIV: Electro-Therapeutics; Galvanic Current; Faradic Current; Static Electricity; Electric Osmosis; Electro-Cautery; Medical Electric Lights.

PRICE $2.00. Sent postage prepaid to any address in the world on receipt of price. The Ideal Work for Electricians, Central Station Men, Engineers, Dynamo Tenders, Linemen, Students, Etc.

ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG., CHICAGO.

BOOKS FOR THE HOLIDAYS.

USEFUL AND APPROPRIATE PRESENTS.

Select such books as you desire and let us quote you our holiday price.

Note the following OFFER TO NEW SUBSCRIBERS: For $3 we will send the WESTERN ELECTRICIAN for one year, 52 times, and as a premium will give one of a number of electrical books FREE. You cannot make a more acceptable present than a year's subscription to the WESTERN ELECTRICIAN. ☛GET FURTHER PARTICULARS OF OUR HOLIDAY OFFER.

New Dynamo Tenders' Hand-Book.

LIEUT. F. B. BADT.

One hundred and forty illustrations. Price, $1. An entirely new and up-to-date work. 226 pages, flexible cloth binding. Size of page 5¾x3½ inches. Designed for dynamo tenders, linemen, stationary and marine engineers. Just the book for men who wish to learn how to operate and care for electric light installations. The only book of the kind in the English language.

Bell Hangers' Hand-Book.

LIEUT. F. B. BADT.

One hundred and six pages, 97 illustrations. Just the book for those engaged in selling, installing or handling electric batteries, electric bells, elevator, house or hotel annunciators, burglar or fire alarms, electric gas lighting apparatus, electric heat regulating apparatus, etc. The only book of its kind. Simple as A B C. Price, $1.

Electricity for Engineers.

CHAS. DESMOND.

Latest edition now published in one volume.' 424 pages. Price, $2.50. Profusely illustrated. For table of contents see advertisement in Western Electrician. Just the work for engineers, electricians, dynamo tenders, etc.

Incandescent Wiring Hand-Book.

LIEUT. F. B. BADT.

Profusely illustrated. Price, $1. Type page 5½x3 inches. Flexible cloth binding, 66 pages, 35 cuts and five tables, three of which are 12x18 inches. These tables give at once, and without any calculation, the size of wire required in each case for any percentage of loss. A timely book, containing full instructions for incandescent wiring, and complete information concerning methods of running wires, location of safety devices and switches, splices, insulation and testing for faults, wire gauges, general electrical data, calculating size of wires, wiring of fixtures, elevators, buildings, isolated and central station plants. The only complete book of the kind published.

Electric Transmission Hand-Book.

LIEUT. F. B. BADT.

Ninety-seven pages, 22 illustrations. 27 original tables. Gives more practical information on the subject than any work published to date. The book contains all necessary information for power producers, capitalists, agents, engineers and motor inspectors. With this book anybody may make estimates on the cost of transmission plants. A practical and reliable work. Price, $1.

Electricity and Magnetism.

PROF. D. C. JACKSON, University of Wisconsin, and others.

A series of thirty-four lessons covering the science of electricity from its fundamental principles to its everyday practical application. Comprises 325 pages, over 300 diagrams and illustrations. Price, $2. A comprehensive treatise in simple language, free from algebraic equations and easily understood.

Electric Lighting Specifications for the Use of Engineers and Architects.

E. A. MERRILL.

Cloth, 176 pages. Price, including postage, $1.50.

Electric Railway Motors; Their Construction, Operation and Maintenance.

NELSON W. PERRY.

An elementary practical handbook for those engaged in the management and operation of electric railway apparatus, with rules and instructions for motormen. 12mo, cloth. New York, 1894. Price, $1.

Dynamo and Motor Building for Amateurs.

LIEUT. C. D. PARKHURST, U. S. A.

Cloth, 163 pages. 71 illustrations. Price, $1. Descriptions and working drawings are given of the following dynamos and motors: A small ventilating fan motor; a sewing machine battery motor, requiring no patterns or castings in its construction; a sewing machine motor of more finished appearance and greater efficiency than the above; a 50-light incandescent dynamo.

The Electric Motor and Its Applications.

T. C. MARTIN and J. WETZLER.

Fourth edition, with an appendix on the development of the electric motor since 1888. By Dr. L. Bell. 300 illustrations, quarto, cloth. New York, 1895. Price, $3

Dynamos, Alternators and Transformers.

GISBERT KAPP.

138 illustrations, 12mo, cloth. London, 1893. Price, $4. In the present work it has been the author's object to place before the reader an exposition of the general principles underlying the construction of dynamo-electric apparatus, and to do this without the use of high mathematics and complicated methods of investigation, thus enabling the average engineering student and the average practical engineer, even if he have no previous knowledge of electrical science, to follow the subject.

Hawkins' New Catechism of Electricity.

A practical treatise. This is a book of 550 pages, full of up-to-date information. 300 illustrations. Handsomely bound in red leather, pocketbook form, size 4½x6½, with titles and edges in gold. Price, $2

Practical Directions for Winding Magnets for Dynamos.

CARL HERING.

12mo, cloth. Reprint, without additions. New York, 1892. Price, $1.25. This book is intended for the practical dynamo designer and constructor, as well as for the student of electrical engineering. The calculations involved are of a very simple nature and may be made by any intelligent mechanic.

The Art of Electro-Metallurgy, Including all Known Processes of Electro-Deposition.

G. GORE.

Fifth edition. 12mo, cloth, illustrated. New York, 1891. Price, $2.

How to Become a Successful Electrician.

T. O'CONNOR SLOANE.

The studies to be followed, methods of work, fields of operation and ethics of the profession. 16mo, cloth. Illustrated. New York, 1894. Price, $1.

The Standard Electrical Dictionary.

T. O'CONNOR SLOANE.

A popular dictionary of words and terms used in the practice of electric engineering. 350 illustrations. 12mo, cloth. New York, 1895. Price, $3. The purpose of this work is to present the public with a concise and practical book of reference, which, it is believed, will be appreciated in the age of electricity. The science has expanded so much that the limits of what must be termed strictly a dictionary of the present day would a few years ago have sufficed for an encyclopædia.

The Arithmetic of Electricity.

T. O'CONNOR SLOANE.

A manual of electrical calculations by arithmetical methods, including numerous rules, examples and tables in the field of practical electrical engineering and experimenting. Fourth edition, revised, 12mo, cloth. New York, 1895. Price, $1.

Dynamo-Electric Machinery.

SYLVANUS P. THOMPSON.

A manual for students of electrotechnics. Fifth edition, revised. 835 pages and 18 folding plates. 8vo, cloth. New York, 1896. Price, net, $5.50. This new edition has been rewritten and thoroughly revised throughout, and is an entirely new book.

Electric Toy Making for Amateurs.

T. O'CONNOR SLOANE.

Electric toy making for amateurs, including batteries, magnets, motors, miscellaneous toys and dynamo construction. Fully illustrated. Second edition. 12mo, cloth. New York, 1893. Price, $1.

How to Wire Buildings.

AUGUSTUS NOLL.

A manual of the art of interior wiring. Fourth edition. 8vo, cloth, illustrated. New York, 1895. Price, $1.50.

The Quadruplex.

WILLIAM MAVER, JR., and M. M. DAVIS.

With chapters on the dynamo-electric machine in relation to the quadruplex. The practical working of the duplex telegraph repeaters and the Wheatstone automatic telegraph. 63 illustrations. 8vo. Price, $1.50.

Primary Batteries.

PROF. H. S. CARHART.

Sixty-seven illustrations. 12mo, cloth. Boston, 1891. Price, $1.50.

Alternating Current Wiring and Distribution.

WILLIAM M. EMMETT.

16mo, cloth, illustrated. New York, 1894. Price, $1. Points out the practical significance of some of the laws governing the distribution of alternating currents, and explains those laws in such a manner that their nature and relative importance may be realized.

Continuous Current Dynamos and Motors.

FRANK P. COX.

An elementary treatise for students and engineers. Illustrated. 12mo, cloth. New York, 1893. Price, $2.

Electric Bells and all About Them.

S. R. BOTTONE.

A practical book for practical men. With more than 100 illustrations. Fifth edition, revised and enlarged. 12mo, cloth. London, 1895. Price, 50 cents.

The Dynamo, How Made and How Used.

S. R. BOTTONE.

A book for amateurs. Eighth edition, with additional matter and 39 illustrations. 12mo, cloth. London, 1895. Price, $1.

First Principles of Electrical Engineering.

C. H. W BIGGS.

Being an attempt to provide an elementary book for those who are intending to enter the profession of electrical engineering. Second edition. Illustrated. 12mo, cloth. London, 1893. Price. $1.

Transformers—Their Theory, Construction and Application, Simplified.

C. H. HASKINS.

Thirty-eight illustrations. 12mo, cloth. Lynn, 1892. Price, $1.25. The author has endeavored to treat of the transformer and its action in such a manner as to render the work of especial value to the central station electrician, the student and the investigator, while the greatest care has been exercised to render the matter so clear, simple and interesting that it may come within the scope of the general public, and meet the demand for a semi-technical and yet semi-popular treatise on the electrical transformer which has not heretofore been obtainable.

How to Build Dynamo-Electric Machinery.

EDWARD TREVERT.

Embracing theory, designing and the construction of dynamos and motors. With appendices on field magnet and armature winding. Management of dynamos and motors, and useful tables of wire gauges. Illustrated. 8vo, cloth. New York, 1894. Price, $2.50.

Dynamos and Electric Motors and All About Them.

EDWARD TREVERT.

One hundred illustrations. 12mo, cloth. Lynn, 1891. Price, 50 cents. This volume not only gives practical directions for building dynamos and electric motors, but also gives a large quantity of information about them.

The Practical Telephone Hand-Book and Guide to the Telephonic Exchange.

J. POOLE.

Second edition, revised and enlarged. 12mo, cloth, with 288 illustrations. London, 1895. Price, $1.50. A thoroughly practical manual, of moderate size and cost, describing the latest development of the subject.

A Manual of Telephony.

W. H. PREECE and ARTHUR T. STUBBS.

With illustrations and plates. 12mo, cloth. London, 1893 Price, $1.50. A new and enlarged edition of Preece & Maier's "The Telephone," issued in 1888.

The A B C of Electricity.

W. H. MEADOWCROFT.

Thirty-six illustrations. 12mo, cloth. New York, 1890. Price, 50 cents.

Houston & Kennelly's Electric Heating.

This book contains a complete treatment of the comparatively new art of electric heating. The various forms of apparatus necessary for the utilization in the arts of the thermal quality possessed by electric currents are illustrated and described in a thorough and comprehensive manner. The difficult problem of the electrical heating of conductors is treated in this work in a way to be readily understood by those not familiar with mathematics or electrical science. Price, $1.

Electrical Power Transmission.

DR. LOUIS BELL

Octavo, cloth. New York, 1896. Price, $2.50. Uniform in size with "The Electric Railway in Theory and Practice."

Pocketbook of Electrical Rules and Tables.

J. MUNRO and PROF. A. JAMIESON.

For the use of electricians and engineers. Eleventh edition, revised and enlarged. 16mo, leather. London, 1895. Price, $2.50.

Electric Lighting.

F. B. CROCKER.

A practical exposition of the art for the use of electricians, students and others interested in the installation or operation of electric lighting plants. Volume I. The Generating Plant. 8vo, cloth. New York, 1896. Price, $3.

A Dictionary of Electrical Words, Terms and Phrases.

PROF. E. J. HOUSTON.

Third edition, revised and enlarged. One volume, 8vo, 750 pages. Illustrated. Cloth. Price, $5. The new edition contains over 5,000 terms and 75 new illustrations. Concise definitions of electrical terms in general use. Illustrated descriptions of electrical apparatus, and clear explanations of electrical phenomena. A work needed in every scientific library and an invaluable reference book to both students and professional men. One of the features of the dictionary is that it is not a mere word-book. The words, terms and phrases are invariably followed by a short, concise definition, giving the sense in which they are correctly employed.

The Electrical Transmission of Energy.

ARTHUR VAUGHAN ABBOTT, C. E.

A manual for the design of electrical circuits. Octavo, cloth, 608 pages, nine folding plates, numerous illustrations. Price, $4.50. The conducting circuit of transmission plants has, as yet, only received incidental treatment in connection with general descriptions of installations for the production and utilization of electrical energy. It is the purpose of the present manual to deal exclusively with the conducting circuit, giving such an account of the materials commonly used for electrical circuits and their disposition, as will enable the designer to accurately and economically plan a conducting circuit for any desired plant.

Practical Dynamo Building.

L. C. ATWOOD.

With detail drawings and instructions for winding. Giving correct sizes of wire, dimensions of iron, etc., etc. Also diagram for house wiring. Illustrations and plates. Quarto, cloth, St. Louis, 1893. Price, $3.

The Elements of Electric Lighting, Including Electric Generation, Measurement, Storage and Distribution

PHILIP ATKINSON, A. M., PH. D.

Eighth edition, revised and enlarged. 264 pages, 12mo. 104 illustrations. Price, $1.50. The eighth edition of this popular work is now ready. It has been thoroughly revised by the author and brought down to date, some of the most important parts rewritten, and new and highly valuable matter introduced, among which are descriptions of new measuring instruments, including Thomson's recording Watt-Meter. It is the most complete exposition of the principles of electric lighting ever written, and its plain, untechnical, unmathematical style commends it to all who desire information on this highly important subject.

The Elements of Dynamic Electricity and Magnetism.

PHILIP ATKINSON, A. M., PH. D.

Author of "Elements of Static Electricity," and "The Elements of Electric Lighting." 405 pages, 12mo, 120 illustrations. Price, $2. A complete, comprehensive treatise on the principles of practical electricity, in the author's well-known, clear, unmathematical style.

Practical Directions for Armature and Field-Magnet Winding.

EDWARD TREVERT.

Containing working directions for winding dynamos and motors, with additional descriptions of some apparatus made by the several leading electric companies in the United States. 12mo, cloth. Illustrated. Price, $1 50

"Wiring Tables; How They Are Made and How to Use Them"

THOS. G. GRIER.

The book contains: The law of resistance, electromotive force and current fully explained; how to calculate the size of wires; the different methods of wiring, with diagrams; how to apply the simple formula, in calculating the size of wires under all conditions, diagrams for wiring 3-point, 4-point, head light and heat regulating switches. Twenty-seven tables on wiring and valuable data. Ohm's law is described in such plain and simple language that one cannot fail to clearly understand it. Bound in cloth. 80 pages. Size, 5x7½ inches. Price, $1.

Electricity in Our Homes and Workshops.

SIDNEY F. WALKER.

A practical treatise on auxiliary electrical apparatus 12mo, cloth, with numerous illustrations. Price, $2.

Electricians' Handy Book of Useful Information.

A. E. WATSON, A. M.

Compiled by E. T. Buhler, 2d. Illustrated. A compilation from the works of Sylvanus P. Thompson, Kapp, Allsop, Munroe and Jamieson, Watson, Bottone, Bonney, Watt, Poole, Trevert, Haskins, Morrow and Reid, and others. Price, cloth, only $2.50, postpaid.

THE ABOVE BOOKS, OR ANY ELECTRICAL BOOK PUBLISHED, SENT ON RECEIPT OF PRICE, PREPAID.

Made in almost any form required and of 1 ohm or 1,000,000 ohms as desired. We also make graphite boxes and crucibles resisting heats of 4,000 degrees. . . . . .

JOS. DIXON CRUCIBLE CO., - - Jersey City, N. J.

WATER WHEELS

For Heads of 3 Feet to 2000 Feet.

Especially adapted to all kinds of

ELECTRIC POWER AND LIGHTING PLANTS.

Recent tests at Holyoke, given below, enable us to guarantee: *The Largest Power ever obtained from a wheel of the same diameter. The highest speed ever obtained for the same power. The highest mean efficiency when running from half to full gate. We guarantee also: A governor of the greatest possible strength. A gate unequaled in quickness and ease of opening and closing.*

Test of a 46 in. SAMSON, Jan. 26, '97.

Gate Open.	Head.	Rev. Per Min.	Cu. Ft. Per Sec.	Horse Power.	Per Cent.
Full	15.00	144.00	179.89	240.97	82.03
¾	15.04	138.12	155 03	223.61	84 55
¾	15.11	127.67	133.24	191.06	83.88
½	15.88	131.59	112.65	164.80	80 25
½	16.47	126.87	90.04	127.73	75.95

Test of a 35 inch SAMSON, Feb.1, '97.

Gate Open.	Head.	Rev. Per Min.	Cu. Ft. Per Sec.	Horse Power.	Per Cent.
Full	15.29	194 25	202.02	343.44	81.08
¾	16.56	187.75	92.15	146.73	84.78
¾	17.33	178.50	83.95	138.40	83.88

JUST WHAT YOU ARE LOOKING FOR!

A New and Valuable Book

Electric Lighting Plants,
THEIR COST AND OPERATION.

By W. J. Buckley. With numerous illustrations, diagrams, plans, tables, etc. 275 pages. Cloth. Price, $2.00, postage free. This work gives all necessary data for the erection of an electric light plant of any size. The cost of Arc Lighting. The cost of Incandescent Lighting.

READ THE TABLE OF CONTENTS:

Alternating Arc Lamps, Arc Plants, Belting, Boilers, Boiler Settings, Boiler Efficiencies, Books, Building, Cost of Arc Dynamos and Lamps, Cost of Arc Plants Erected, Cost of Alternating Dynamos, Cost of Alternating Plants Erected, Cost of Belts, Cost of Boilers, Cost of Brick Chimneys, Cost of Copper for Alternating Circuit, Cost of Corliss Engines, Cost of Compound Corliss Engines, Cost of Compound High Speed Engines, Cost of Condensers, Cost of Friction Clutch Pulleys, Cost of Heaters, Cost of High Speed Engines, Cost of Incandescent Dynamos, Cost of Idlers, Cost of Injectors, Cost of Meters, Cost of Motors, Cost of Operating Lamps per hour, Cost of Power Generators, Cost of Poles, Cost of Plain Pulleys, Cost of Pillow Blocks, Cost of Pumps, Cost of Shafting, Cost of Shaft Couplings, Cost of Stacks—Iron, Cost of Stacks—brick, Cost of Steam, Cost of Transformers, Cost of Wire, Chimneys, Circuit Loss, Contract Blanks, Current Distribution, Circuits—overhead, Circular Mils of Wire, Depreciation, Direct Connected Apparatus, Dynamos, Dynamo Data, Economy of Condensing, Economy of Covering Steam Pipes, Economy of Heater, Efficiency of Engines, Engines, Equivalent of Current in Horse Power, Equivalent Rates of Lighting, Fuel, Horse Power of Belting, Horse Power of Motors, Horse Power of Shafting, Incandescent Arc Lamps, Instruments, Instructions for Employes, Insulation, Labor, Load Chart, Meter Connections, Municipal Ownership, Natural Gas, N. E. L. A. Standard Rules, Oil, Outcome of Practical Management, Pole Line, Pulleys, Rope Transmission, Resistance of Wire, Rules—Fire Underwriters, Report Com. on Data N. E. L. A., Reports of Cities Owning Plant, Reports of Cities Contracting, Stock Room, Shafting, Transformers, Transformer Curves, Wiring Tables—Primary Wiring, Wiring Tables—Secondary Wiring, Wiring Tables, Motor Wiring, Wire, Wire Formula, Water Power, Wood as Fuel. The only book of its kind in the English Language. **Price, $2.00.**

ELECTRICIAN PUBLISHING COMPANY,
Suite 510 Marquette Building, Chicago.

EDDY GENERATORS.

Direct Connected or Belted for Electric Railways, Central Stations, Isolated Lighting or Power Plants.

Eddy Motors—Slow, Medium or High Speed.

"SHIP CARBONS."

Owing to the increased demand for a **STRICTLY HIGH-GRADE CARBON,** we have been compelled to increase our manufacturing facilities, and have acquired control of the works of Julius Fuchs in Nuernberg, manufacturer of the Electra Carbons. The product of this well-known factory will hereafter bear only our trademark, **"SHIP CARBON," VIENNA-NUERNBERG.**

Write for Price List and Samples of Carbons for Long-Burning Lamps, Carbons for Alternating and Direct Current, Search Light Carbons, etc.

SCHIFF, JORDAN & CO.,

232-234 GREENWICH STREET. . . . . NEW YORK.

Makes No Noise, Makes Money.

May we send our illustrated circular?

To the "old guard" of operating engineers who are used to a dynamo with more parts than a thirty-day-calendar-clock, the **Warren Generator** (***without a commutator, without brushes, without collector rings, without moving wires of any kind***) is an innovation for which they are duly and appropriately thankful. To them and to all users of Dynamos we wish a Happy New Year.

WARREN ELECTRIC MANUFACTURING CO.,
SANDUSKY, OHIO.

WHEN IN NEED OF
Electrical Supplies

OF ALL KINDS, ASK US FOR PRICES. WILL MAKE LOWEST QUOTATIONS AND THE VERY PROMPTEST SHIPMENTS. . . . . .

RELIABLE ELECTRICAL SUPPLY CO.,

236 E. Madison St. CHICAGO.

TRADE MARK:
"Chloride Accumulator"
REGISTERED SEPTEMBER 11, 1894.

THE WESTERN UNION TELEGRAPH COMPANY

Is Installing in its Memphis Office 436 Chloride Accumulators, Displacing 5,250 Gravity Cells.

Atlanta, Washington, New Orleans and eighteen smaller offices are already equipped with Chloride Accumulators, which have effected a great reduction in the cost of maintenance and an improvement in the wire service.

THE ELECTRIC STORAGE BATTERY CO.,
DREXEL BUILDING, PHILADELPHIA, PA.

Branch Offices: 20-22 Broad St., New York. Equitable Bldg., Baltimore, Md. Marquette Bldg., Chicago, Ill. 222 Market St., San Francisco, Cal. 60 State St., Boston, Mass.

CATALOGUES.

Carbon Rheostats,
Carbon Starting Boxes,
Carbon Car Heaters,
Carbon Resistances,
FOR ALL PURPOSES.

Cannot Burn Out When Overloaded.

The only resistances not subject to induction currents, and therefore the only practical instruments, excepting lampboard rheostats, for tests with alternating dynamos.

Retain an almost equal resistance whether hot or cold. In other words, not subjected to any outside influences whatsoever.

Starting boxes safely permit a continuous current of two minutes and more, and are tested with an overload of 25 per cent.

Inquiries, investigations and severest tests invited. Send for descriptive circular and price list.

Raster Carbon Rheostat Co.,
Office, 414 Ashland Block,
Factory, 194-202 Clinton St., CHICAGO.

YOUR SUPPLY MAINTAINED FOR 12c.

LAMPS Efficient, Long-Lived and Guaranteed Satisfactory.

Write us before making another contract. We are THE Lamp Renewing Company you have heard of.

Lynn Incandescent Lamp Co., Lynn, Mass.

A TECHNICAL EDUCATION 50 CENTS A WEEK.

The new installment plan of The International Correspondence Schools, Scranton, Pa.—the largest and most successful institution teaching technical subjects by mail—places an education within the reach of all. Students may enroll upon paying $2 in advance, the balance to be paid at the rate of $2a month. The charges are moderate and include all necessary text-books. Studies are carried on at home without loss of time from work.

The Electrical Power and Lighting Scholarship is a thorough course of instruction in the installation, care and operation of electric light, power and railway plants designed to meet the wants of busy men who wish to put into actual practice as soon as possible the information they acquire.

The Mechanical-Electrical Scholarship includes instruction in mechanical and electrical engineering and is intended especially for those who wish to become designers of electrical machinery.

Also Courses including Steam Engineering, Mechanical Drawing, Machine Design, Civil Engineering, Bookkeeping, Shorthand and English branches.

Write for circular stating subject in which you are interested.

THE INTERNATIONAL CORRESPONDENCE SCHOOLS, BOX 1002, SCRANTON, PA.

Phila., Jan'y 1, 1898.
125 South Second Street.

FRANKLIN S. CARTER,
CHARLES M. WILKINS,
E. WARD WILKINS,

1898.

GENERAL SUPPLIES
FOR ALL DEMANDS.

GOOD CARBONS MEAN LESS COST FOR CURRENT. Therefore, wherever a highly efficient service is desired, it is of the utmost importance to use the best Carbons obtainable.

"All the excellence in dynamos and arc lamps counts for but little, when poor Carbons are used in the lamps."

NOTICE.—The "Electra" Highest Grade Nuernberg Carbons are, as heretofore, manufactured by the world-renowned firm of C. Conradty of Nuernberg. See that every package of my Carbons bears the label with my trade-mark "Electra," and thus beware of imitations.
To protect the interest of purchasers of my Carbons, I am determined to proceed against infringers of my "Electra" trade-mark.

S-C-P

WHEN USED IN CONNECTION WITH THE

Hardy Incandescent Lamp

STANDS FOR

Sustained Candle Power, the Lamp's Strong Point.

To prove it we will send by express, charges prepaid, one dozen 16 C. P. 3 or 3½ watt lamps, any base, any voltage, from 45 to 125 volts, for $2.16.

AGENTS WANTED. **WRITE FOR PRICES.**

A GOOD THING!

"CLEANOR."

THE MOST EFFECTIVE CLEANER EVER PUT ON THE MARKET. Indispensable for cleaning Street Cars, Telephone Boxes and other electrical or other woodwork. A boon for tidy station managers. Used extensively by Street Railway Companies, Hotels, Theaters and Furniture Dealers for renovating. Makes woodwork and furniture look like new, and Does it Without Rubbing. Removes dust, dirt, grease and oil, leaving the finish as fresh as the day it was put on. No trouble to use it. No water to splash around and drip, and does the work quickly and easily. The only preparation that leaves the finish absolutely clear and unclouded. If your dealer does not handle it, write us direct.

2 oz. cans .. price, 15c. each, $1.60 per doz. 4 oz. cans .... price, 25c. each, $2.75 per doz.
24 oz. pails .. price, $1.00 each, $11.00 per doz.

In Going to St. Paul and Minneapolis

The wise traveler selects the Chicago, Milwaukee & St. Paul Railway.
Why?
It is the best road between Chicago and the Twin Cities.
It has the most perfect track.
Its equipment is the finest.
Its sleeping cars are palaces.
Its dining-car service is equal to the best hotels.
Its electric-lighted trains are steam-heated.
Its general excellence has no equal.
It is patronized by the best people.
It is the favorite route for ladies and children as well as for men.
It is the most popular road west of Chicago.
It gives the choice of seven trains daily.
City Ticket Office, 95 Adams St., Chicago.

We have issued a NEW catalogue of electrical books containing 100 pages, listing every work on electricity. A copy will be cheerfully mailed on receipt of a two-cent stamp.

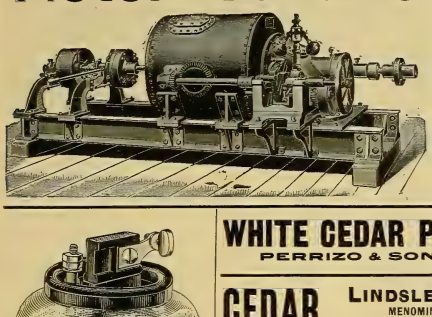
Victor Turbine Water Wheel.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter,** being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 88 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts and where the situation admits of their use we recommend them.

New Dynamo Tenders' Hand-Book.

By F. B. BADT.

226 Pages. 140 Illustrations. Flexible Cloth Binding. Size of Type Page 5 1-2x3 inches. Price $1.00.

This is, as the name indicates, a NEW BOOK, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers, and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 9,000 copies of the old Dynamo Tender Hand-Book sold, and over 5,000 of the new.

OFFICE
The Ferris Wheel Co.
1131 THE ROOKERY

CHICAGO, April 30, 1896.

NEW YORK INSULATED WIRE CO.,
320 Dearborn St., Chicago, Ill.

GENTLEMEN:—After carefully considering the merits of the various brands of wire upon the market, we have decided to use your "Raven White Core" exclusively for rewiring the Ferris Wheel.

As you are aware, the wire upon the wheel is very much exposed and the test will no doubt be a most severe one.

Yours very truly
THE FERRIS WHEEL CO.
By L. V. Rice, Mgr.

GRIMSHAW WHITE CORE. Used exclusively for all Incandescent Lighting at World's Columbian Exposition.

RAVEN WHITE CORE. Used in some of the largest buildings in the United States.

THE TELEPHONE HAND-BOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price $1.00.

EXTRACT FROM PREFACE.

"The little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical work on the telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice, and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No telephone hand-book published since the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything to be said. Its make-up is in accordance with its contents, which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit
8. Magneto Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magneto Telephones.
11. The Gower, Adie and D'Arsonval Receivers. Mr. Preadler's Bi-Telephone
12. The Stearns, Kokyra, Neumayer and Both-the Receivers
13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction.
28. Metallic Circuit.
29. Underground Wires.
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser; Its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony Appendix.

Published and for sale by ELECTRICIAN PUBLISHING CO., 510 Marquette Building, Chicago.

American Electric Telephone Co.,

CHICAGO.

The Lockwood Transmitter

Is protected by letters patent No. 528640 and No. 557588, issued Nov. 6, 1894, and April 7, 1896, respectively.

The electrodes have "A variable air space" between them, and the adjustment is obtained by tension instead of pressure. The Lockwood is positively the only Transmitter on the market having no contact BETWEEN electrodes, consequently parties liable to infringement suits and promoters of long-distance systems will find it to be the only telephone that will satisfy the fears of their subscribers. The Transmitter can be placed upon any instrument now in use, and an exchange of Transmitters is easily effected.

Address:

The Lockwood Long Distance Telephone & Telegraph Company of America,

A New and Valuable Book

Electric Lighting Plants,

THEIR COST AND OPERATION.

By W. J. Buckley. With numerous illustrations, diagrams, plans, tables, etc. 275 pages. Cloth. Price, $2.00, postage free. This work gives all necessary data for the erection of an electric light plant of any size. The cost of Arc Lighting. The cost of Incandescent Lighting.

READ THE TABLE OF CONTENTS:

Alternating Arc Lamps, Arc Plants, Belting, Boilers, Boiler Settings, Boiler Efficiencies, Books, Building, Cost of Arc Dynamos and Lamps, Cost of Arc Plants Erected, Cost of Alternating Dynamos, Cost of Alternating Plants Erected, Cost of Belts, Cost of Boilers, Cost of Brick Chimneys, Cost of Copper for Alternating Circuit, Cost of Corliss Engines, Cost of Compound Corliss Engines, Cost of Compound High Speed Engines, Cost of Condensers, Cost of Friction Clutch Pulleys, Cost of Heaters, Cost of High Speed Engines, Cost of Incandescent Dynamos, Cost of Idlers, Cost of Injectors, Cost of Meters, Cost of Motors, Cost of Operating Lamps per hour, Cost of Power Generators. Cost of Poles, Cost of Plain Pulleys, Cost of Pillow Blocks, Cost of Pumps, Cost of Shafting, Cost of Shaft Couplings, Cost of Stacks—iron, Cost of Stacks—brick, Cost of Steam, Cost of Transformers, Cost of Wire, Chimneys, Circuit Loss, Contract Blanks, Current Distribution, Circuits—overhead, Circular Mils of Wire, Depreciation, Direct Connected Apparatus, Dynamos, Dynamo Data, Economy of Condensing, Economy of Covering Steam Pipes, Economy of Heater, Efficiency of Engines, Engines, Equivalent of Current in Horse Power, Equivalent Rates of Lighting, Fuel, Horse Power of Belting, Horse Power of Motors, Horse Power of Shafting, Incandescent Arc Lamps, Instruments, Instructions for Employes, Insulation, Labor, Load Chart, Meter Connections, Municipal Ownership, Natural Gas, N. E. L. A. Standard Rules, Oil, Outcome of Practical Management, Pole Line, Pulleys, Rope Transmission, Resistance of Wire, Rules—Fire Underwriters, Report Com. on Data N. E. L. A., Reports of Cities Owning Plant, Reports of Cities Contracting, Stock Room, Shafting, Transformers, Transformer Curves, Wiring Tables—Primary Wiring, Wiring Tables—Secondary Wiring, Wiring Tables, Motor Wiring, Wire, Wire Formula, Water Power, Wood as Fuel. The only book of its kind in the English Language. **Price, $2.00.**

ELECTRICITY AND MAGNETISM.

325 PAGES. PRICE $2.00. 347 ILLUSTRATIONS. A series of Thirty-four Practical Lessons covering the Science of Electricity from Its Fundamental Principles to Its Every-day Applications. By Prof. D. C. Jackson, University of Wisconsin; Prof. H. S. Carhart, University of Michigan; Prof. B. F. Thomas, University of Ohio: Prof. Wm. A. Anthony, of New York; Prof. Brown Ayres, Tulane University; Prof. A. C. Perrine, Leland Stanford University, Cal.; Prof. Geo. D. Shephardson, University of Minnesota, and others. A Comprehensive Treatise in Simple Language, Free from Algebraic Equations and Easily Understood.

CONTENTS:

CHAPTER I: The Nature and Properties of Electricity; Origin of Electricity; Two Kinds; Laws of Attraction and Repulsion; Positive and Negative Charge; Terms, Conductors, Insulators, Electric Conductivity; Conveying Electricity; The Electroscope; Force Exerted Between Charged Bodies; Unit of Measurement, of quantity of Electricity; Electrometer.—CHAPTER II: Machines for Generating Electricity by Friction and by Electric Induction; Making Machine to Continuously Generate Electricity by Friction; The Electrophorus; Induction Generator; Units of Electric Current and Pressure; Electricity Conveyed by Unit Current Each Second; Negatively and Positively Charged Conductors; Relation of Lightning and Sparks of Electrical Machine.—CHAPTER III: Electric Batteries or Appliances for Generating Electricity by Chemical Action; Action of Batteries; Electric Pressure; Voltaic Electricity; Direction of Current Flow; Production of Continuous Current; Battery Cells in Series; Production of Pressure by Cells; Polarization and Its Avoidance; Leclanche Cell; Open Circuit Cells.—CHAPTER IV: Electric Batteries or Appliances for Generating Electricity by Chemical Action (Concluded); Closed Circuit Cells; Local Action; Law of Electro-chemical Action; Electro-chemical Equivalent; Primary Batteries Compared with Dynamos for Furnishing Current; Uses of Batteries; Difference Between a Primary and Storage Battery; How Storage Batteries are Made; Parallel Connection of Plates in Storage Batteries.—CHAPTER V: The Nature and Properties of Magnetism, Magnetic Fields; Permanent Magnetism; Magnetic Attraction and Repulsion; Poles of Magnet; Magnitude of Force Between Two Magnets; Aging Magnets; Earth's Action on Magnetic Needle; Magnetic Field; Action of Lines of Force.—CHAPTER VI: The Magnetic Effects of Electric Currents and Magnetic Circuits; Effect of Electric Current on Magnetic Needle; Relation Between Direction of Lines of Force and Direction of Current Flow; Determination of Current Direction by Compass; Ampere Turns; Solenoids; Ampere's Theory; Solenoids with Steel or Iron Cores; Residual Magnetism; Electro-Magnets; Magnetic Permeability; Magnetic Reluctance; Magneto Motive Force or Magnetic Pressure.—CHAPTER VII: Ohm's Law of the Flow of Electricity; Pressure; Resistance; Current; Volt; Ohm; Ampere; Mercury Resistance; Conductivity of Copper Compared with Other Metals; Resistance of Circuits Made Up of the Same Parts in Parallel; Joint Resistances; Fall of Voltage Over Resistance, Effect of Temperature on Resistance; Copper Temperature Coefficient.—CHAPTER VIII: Heating Effects of Electric Currents; Miscellaneous Effects of Electric Currents; Foot-pound; Joule; Horse-power; Watt; Kilowatt; Watts per Horse-power; Heating Effects on Bearings of Machinery; Effect of Electricity on Nerves of Animals; Muscular Effect of Strong Currents.—CHAPTER IX: Galvanometers and Voltameters; Differences in Construction for Large and Small Currents; Presence and Direction of Currents Shown by Galvanometer; Strength of Current Indicated; Tangent Galvanometer; Reflecting Galvanometer; Needle Suspension; d'Arsonval Galvanometer; Terms "Dead-Beat," "Calibrate;" Voltameter; Electrolyte, Electrolysis; Electrode; Forms of Voltameters.—CHAPTER X: Measurement of Electrical Resistance; Resistance Measured by Substitution; Resistance Boxes; Use of German Silver; Coils; Wheatstone Bridge; Measuring Resistances with Bridge; Measuring Very High Resistances; Practical Examples.—CHAPTER XI: Every-day Measurements of Electric Currents and Pressure; Three Effects by Which Currents are Directly Measured; Amperemeters; Milliampere; Microampere; Three Classes of Magnetic Amperemeters; Weston Amperemeter; Electro Dynamometers; Hot Wire Instruments; Scales of Amperemeters; Alternating Current Measuring Instruments; Measuring Very Large Currents; Measuring Electric Pressures; Voltmeters; Cardew Voltmeter; Electrometers; Electrostatic Voltmeters; Standard Cells; Measuring Currents by Voltmeter and a Standard Resistance.—CHAPTER XII: Every-day Measurements of Electric Power, Condensers and The Measurement of their Capacity; Wattmeters; Electro-dynamometer Used as Wattmeter; Recording Wattmeters; Coulomb Meters; Watt Hour; Ampere Hour; Capacity; Farad; Microfarad; Condenser; Capacity of Condenser; Charging Condenser; Specific Inductive Capacity; Selection of Insulation for Telephone Cables; Capacity of Underground Wires; Comparing Capacities by Ballistic Galvanometer; Practical Capacity Measurements; Leyden Jar.—CHAPTER XIII: Electrolytic Deposition of Metals; Electroplating; Metals Commonly used in Plating; Salt of a Metal; Nitrate of Silver; Cyanide of Silver and of Potassium; Solution for Silver plating; Vats; Quality of Electrolytic Deposit; Effect of Too Great or Small Currents; Cleaning Articles to be Plated; Gilding Inside of Silver Articles; Base Metals on Which Nickel is Usually Plated; Solution for Nickel Plating; Electrotyping; Electrotype Molds; Electrotype Finishing; Electrolytic Refining of Copper; Solution Used.—CHAPTER XIV: The Electric Telegraph; Elements of Electric Telegraph; Telegraph Circuits; Telegraphic Signals; Sending and Receiving; Telegraph Lines; Sounder; Relays, Local Circuits; Multiple Telegraphy; Duplex Telegraphy; Diplex Telegraphy; Quadruplex Telegraphy.—CHAPTER XV: Multiple Telegraphy; Differential Relay; Polarized Relay; Pole Changer; Principles of Operation of Diplex, Quadruplex, Bridge Duplex; Artificial Line; Autographic Telegraphy.—CHAPTER XVI: The Telephone; Bell Telephone; Microphone; Blake Transmitter; Exchanges; Switchboard; Long-Distance Transmitter.—CHAPTER XVII: The Construction of Telegraph and Telephone Lines and Instruments; Poles; Cross-Arms; Pins; Joints; Insulators; Insulation; Ground Plates; Underground Cables; Conduits, Fuses; Multiple Switchboards.—CHAPTER XVIII: Testing Lines for Insulation and Conductivity and the Location of Leaks and Breaks; Line Troubles; Grounds; Crosses; Locating Trouble; Earth Currents; Line Conductivity and Insulation; Testing.—CHAPTER XIX: Principles of Continuous Current Dynamos and Motors; Electric Conductor in Magnetic Field; Field Strength, Induced Electric Pressure; Direction of Current Moving Conductors; Alternating Current; Dynamos; Magnetos; Commutator.—CHAPTER XX: Principles of Continuous Current Dynamos and Motors; their Construction, Care and Attendance; Gramme Armature; Siemens Armature; Armature Current; Laminating Cores; Foucault or Eddy Currents; Hysteresis; Fundamental Principles of Dynamos and Motors; Points of Good Dynamo; Counter Electric Pressure; Types of Field Windings; Series, Shunt and Compound Wound Machines; Multipolar Machines; Regulation, Care and Maintenance.—CHAPTER XXI: Arc Lighting and Arc Light Machinery; The Arc; Arc Lamps; Principles of Operation; Connections; Arc Dynamos, Current and Pressure Required; Making of Arc Carbons; Regulators; Arc Light Switchboards.—CHAPTER XXII: Incandescent Lighting and Power Transmission, Two, Three and Five Wire Systems of Distribution for Electric Lights and Motors; Incandescent Lamp; Filaments; Vacuum; Material for and Making of Filaments, Advantages of Incandescent Lamps; Incandescent and Motor Circuits; Constant Pressure; Loss of Voltage; Circular Mils; Practical Examples; Weight of Copper Required for Transmission of Power at Different Pressures; Three-Wire System; Motor Starting Resistances.—CHAPTER XXIII: Construction of Electric Light and Power Circuits, and Their Testing; Overhead Electric Light Wires; Weather-Proof Wire; Arc Circuit Wires; "Drawing In" and "Built In" Underground System; Underground Electric Light Cables; Edison Tubing; Feeders; Mains; Inside Wiring; Cleat Work; Moulding Work; Concealed Work; Dangers from Fires; Distribution System.—CHAPTER XXIV: Testing Electric Light Circuits and the Distribution and Measurement of Light; Faults; Soldered Joints; Magneto Bell; Use of Voltmeter to Locate Grounds on Arc Circuits; Ground Detector; General Testing; Photometer; Standard Candles; Illuminating Effect of Lamps; Effect of Opal Globes.—CHAPTER XXV: Electro-Magnetic Induction; Effect of Cutting Lines of Force by an Electric Conductor; Induced Currents; Induction Coils; Cores of Induction Coils; Transformers; Direction of Induced Current; Self Induction; Attraction and Repulsion of Parallel Wires Carrying Currents.—CHAPTER XXVI: Alternating Currents; Alternator; Electrolytic Effect of Pulsating Current; Heating Effect of Alternating Current; Effective Value; Alternating Current; Measurements; Frequency; Period; Apparent Resistance.—CHAPTER XXVII: Alternating Currents and Alternating Current Machinery (Concluded); Power Used in Alternating Circuits; Alternating Currents for Lighting; Making Transformers; Testing Transformers; Building Alternators; Number of Alternations; The Exciter; Running Alternators in Parallel; Synchronous Motors; Two-Phase and Three-Phase Systems; Induction Motors; Squirrel-Cage Armature; Mesh Connection; Star Connection.—CHAPTER XXVIII: Miscellaneous Applications of Electric Motors; Uses of Electric Motors; Motors in Machine Shops; Waste of Power in Factories; Advantages of Removing Shafts and Belts; Estimating Electrical Power Required; Electric Elevators; Electric Launches.—CHAPTER XXIX: Electric Railways; Richmond Electric Railroad; Trolley Wire; Trolley; Track; Use of Two Motors; Rail Bonds; Heavy Electric Locomotives.—CHAPTER XXX: Methods of Handling and Controlling Railway Motors and Generators; Output Records; Recording Voltmeters; Load of Electric Railway Plant; Application of Storage Batteries to Smooth Road Curve; Methods of Controlling Street Car Motors; Station Instruments; Equalizer.—CHAPTER XXXI: Model Electric Plant; First Central Station; Changes in General Mechanical Construction of Dynamos; Instruments; Multiple Arcing Galvanometers; Use of Double and Single Pole Switches; Operating Dynamos in Parallel; Feeder Connections in Continuous and Alternating Stations; Throwing Dynamo into Circuit; Cutting Dynamo Out.—CHAPTER XXXII: Underwriter's Rules, Etc.; Necessity of Rules; Special Points in Wiring; Insulation of Sockets, Fuses, Fixtures; Annunciator Wire; Office Wire; Leaky Wires.—CHAPTER XXXIII: Electric Welding, Forging, Etc.; Electricity Applied to the Kitchen; Electrical Methods Applied to Metal Working; Thomson Apparatus for Heating Metals; Welding by Thomson Method; Bernardos Process of Working Metals; Bringing Piece of Metal to High Temperature by Dipping in Pail of Water; Electric Current for Warming and Cooking; Electric Heating and Stoves Compared.—CHAPTER XXXIV: Electro-Therapeutics; Galvanic Current; Faradic Current; Static Electricity; Electric Osmosis; Electro-Cautery; Medical Electric Lights.

PRICE $2.00. Sent postage prepaid to any address in the world on receipt of price. The Ideal Work for Electricians, Central Station Men, Engineers, Dynamo Tenders, Linemen, Students, Etc.

A VALUABLE BOOK FOR ENGINEERS AND FIREMEN NOW READY.

MODERN EXAMINATIONS OF STEAM ENGINEERS or PRACTICAL THEORY EXPLAINED and ILLUSTRATED.

BY W. H. WAKEMAN.

12 mo. Cloth. 272 pages. 53 Chapters.

Containing a complete list of 300 questions such as will be asked of any Engineer when taking examination for U. S. Government or State License, all of which are fully answered in the text.

PRICE, $2.00

Postage prepaid, to any part of the world

This book which is specially adapted for engineers' examinations, is also intended as a practical guide to Engineers, Firemen, Boiler Makers, Machinists, and others, in daily practice.

The author being a practical steam engineer himself, well knows the wants of the working engineer, and has put into this work such knowledge and information as is best adapted to their use, making it altogether the most complete and comprehensive guide for the busy workers in the engine room, boiler works and machine shops that has ever been published.

As one engineer who has read the book says: "I think there are few engineers that it wouldn't do some good. It seems as if it was a review of all I have ever read, and a lot more besides."

The author has treated of a very great variety of subjects which are of vital importance to all who wish to improve and extend their knowledge of steam engineering, and has explained the rules and formulas given, in the simplest manner possible, and has worked out examples by them, so that all who can read may understand them.

The 300 questions are an important feature of the book, they are entirely separate from the 53 chapters of reading matter, and were written after many years of practical experience and careful research by the author.

His connection with the Boardman Manual Training High School at New Haven, Conn., as Instructor in Steam Engineering, his 12 years of active membership in the N. A. S. E., and his position as Instructor of No. 10 of Conn., a sturdy branch of the National Organization, makes him especially competent in this part of the work.

The many flattering commendations which this book has already received from competent judges and high authorities, speak well for its value.

ELECTRICIAN PUBLISHING COMPANY, - - - Suite 510 Marquette Building, Chicago, Ill.

••• THOMSON •••

Inclined Coil Standard Switchboard Instruments.

Ammeters and Voltmeters for all Alternating Current Measurements.

CAN BE USED ON DIRECT CURRENTS.

High Grade, Reliable, Accurate for all Frequencies.

Permanent Calibration. No Parts Liable to Injury or Alteration from Use. Binding Posts Top or Bottom. Dead Beat. Long Scale. Low Price. From 10 to 1,000 Ampere. 75, 150, 650 Volts.

ELECTRICITY FOR ENGINEERS.

Latest Edition, Now Published in One Complete Volume, 424 Pages, Profusely Illustrated.
Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

PART I. CONTENTS.—CHAPTER I: Electricity; Positive and Negative; Conductors, Non-Conductors and Insulators; Electro-Motive Force, Volts; Resistance, Ohms; Current, Amperes.—CHAPTER II: Dynamos; Magnets; Field Coils; Electro Magnets; Permanent Magnets.—CHAPTER III: Armatures, Constructed on Shaft, Different Types; Commutator Bars; Commutator Connected; Heating of Armatures; Eddy Currents.—CHAPTER IV: The Current; How Produced; Induction; Series Wound Dynamos; Shunt Wound Dynamos; Exciting the Fields; Constant Current and Constant Potential Dynamos; Series and Parallel; Parallel or Multiple Arc System.—CHAPTER V: Incandescent Lamps; Filaments; Connections; Flashing; Exhausting; Testing; Candle Power; operated in Series; Automatic Cut-Out; in Multiple Arc or Parallel; Multiple Series; Multiple Series Cut-Out; Three Wire System.—CHAPTER VI: The Arc Light; How Formed; Causes of Disturbances; Remedy; Effect of Shadows or Globes; Shape of Carbons; Under Different Conditions of Burning; Arc Lamps; Regulating and Cut-out Mechanism; Action of Current; Clutch Lamps; Clockwork Lamps; Double Lamps; Troubles in Lamps.—CHAPTER VII: Commutators and Brushes; The Brush Commutator; Brushes, Different Styles of Brushes; Double Brushes; Single Brushes; Troubles with Commutators and Brushes; Correct Position of Brushes; Sparking at Brushes; Care of Brushes and Commutators; Flashing.—CHAPTER VIII: Current Regulation; Hand Regulation; By Position of Brushes; Resistance Box, Resistance Coils.—CHAPTER IX: American System of Automatic Current Regulation; The Dynamo, Regulator; Action of Regulator.—CHAPTER X: Brush System of Automatic Current Regulation; Diagram of Circuits through Dynamo, Regulator and Lamps; Dial or Regulator; Care and Adjustment of Dial.—Dial Controller; Details and Connections of No. 4 Brush Dynamo; Circuits of Compound Wound Constant Potential Brush Dynamo.—CHAPTER XI: The Edison System; Automatic Regulator; Circuits of Regulator; Circuits of Dynamo; Action of Regulator; Recoil Pressure Indicator; Diagram of Circuits; Description of Parts and Operation.—CHAPTER XII: Excelsior System of Automatic Current Regulation; Dynamo; Armature; Diagram of Circuits.—The Regulator and Motor; Action of Regulator.—CHAPTER XIII: Schuyler System of Automatic Current Regulation; Dynamo; Armature, Commutator and Brushes; Diagram of Circuits in Armature and Field; Regulator; Circuits in Regulator.—CHAPTER XIV: Thomson-Houston System of Automatic Current Regulation; Dynamo; Armature; Commutator and Brushes; Controlling Magnet; Wall Controller, Diagram of Circuits; Air Blast.—CHAPTER XV: Westinghouse System of Three Brush Automatic Current Regulation; Dynamo; Extra Brush; Resistance Coils and Regulator.—CHAPTER XVI: Ampere Meters, Tangential Scale; Solenoid Meters.—CHAPTER XVII: Voltmeters, Pressure and Potential Indicators.—CHAPTER XVIII: Testing; Galvanometers; Astatic Needle; Differential Apparatus.—CHAPTER XIX: Wheatstone Bridge or Electrical Balance; Diagram of Circuits and Methods of use; Bridge and Rheostat; Round Form, Square Form.—CHAPTER XX: The Magnetometer a Testing Instrument; Armature; Field, Bell; Diagram of Circuits.—CHAPTER XXI: Coupling Dynamos Together; In Series; In Shunt; Series, Shunt and Compound Wound Machines.—CHAPTER XXII: Switches and Switchboards; Loop Switch; Plug and Socket; Change Over Plug and Socket; Conclusion.—CHAPTER XXXIII: Electric Motors; General Principles the Same as in Dynamos; Types; Shunt and Series Motors Suitable for all General Purposes; Regulation of Shunt Motors; Of Series Motors; Counter E. M. F.; Direction of Rotation and Direction of Current; Starting Motors; Diagram of Connection.

PART II. CONTENTS.—CHAPTER I: Alternate Current Dynamos; Principles of the Field; Field Current Armature; Winding; Connections; Lamination; Different Types of Alternators; Regulation; Leading Systems; The Brush Generators; Magnets; Armature; Principles of Induction.—CHAPTER II: Dynamos, Continued; Re-Excitation; Alternator; Stationary Armature; Field Magnets; Ferranti Armature; Field Magnets; Winding; Collectors.—CHAPTER III: Dynamos Concluded; Siemens Dynamo; Best Magnetic Circuits; Stanley Constant Current Dynamo; The Armature; Self Induction; Regulation.—CHAPTER IV: Induction Coils; Converters; Transformers; Economy of Distribution, An Electrical H. P.; Losses in Conductor; Induction Coils; Effect of Induction; Transformers.—CHAPTER V: Transformers Continued; Induction Coils; Converters; Transforming Up and Down; Design of Transformers; The Static Charge, Protection Against; Grounding the Secondary; Mitchell Devices; The Fuse Protector; Different Types of Transformers.—CHAPTER VI: Transformers, Concluded; Fuses; Regulation; Winding of Transformers; Connecting to a Circuit; Regulation; Safety Fuses.—CHAPTER VII: Parallel System; Series Arc Light System; Diagram of Circuits; Parallel System; Primary Circuit; Secondary Circuit; Theory of Transformers; Fuses; Diagram of Series Arc Light Circuit.—CHAPTER VIII: Lines of Force; Hysteresis; Magnetic Penetration; The Circuit of Lines of Force; Experiments with Magnet; Rigidity of Reversals and Hysteresis.—CHAPTER IX: Arc Lamps; In Series; The Westinghouse Arc Lamp; Diagram of Circuits in Lamp; Action of the Mechanism; Pilot Carbons.—CHAPTER X: Arc Lamps in Multiple; Shunt or Differential Lamps; Mechanism of Lamp; Its Operation.—CHAPTER XI: Measuring and Indicating Apparatus; Instruments for Use with Alternating Currents Differ from Those used with Continuous Currents; Ammeters; Voltmeters; Description of Several Forms of Instruments.—CHAPTER XII: Measuring Instruments, Continued; Hot Wire Instruments; The Cardew Voltmeter; Details of the Instrument; Low Potential Voltmeter.—CHAPTER XIII: Voltmeters, Double Coil Voltmeter; Two Types.—CHAPTER XIV: Spring Meters; Cubed Spring Meter.—CHAPTER XV: Twisted Strip Instruments; Diagram of Connections and Operation of Instrument.—CHAPTER XVI: Recording Meters; Stanley Meter; Construction and Principles of Operation; Diagrams of Parts.—Slattery Induction Meter; Description of Parts and Principles of Operation.—Shallenberger Meter; Thomson Meter.—CHAPTER XVII: Generators in Parallel; Difficulties in Operating; Alternate Current Generators in Parallel; Arrangements of Circuits and Methods of Operating in Parallel; Diagram of Common Arrangement of Machines and Circuits.—CHAPTER XVIII: Ohm's Law; Strength of Current; Formulas and Examples; Power and Heating Effects of Currents.—CHAPTER XIX: Ground Alarms and Leak Detectors.

PRICE, $2.50.

NEW YORK OFFICE: 39-41 CORTLANDT STREET, NEW YORK CITY.

A WARNING

TO USERS AND PURCHASERS OF

KEYSTONE INSTRUMENTS.

We have recently learned that an unscrupulous contracting and manufacturing concern is supplying their trade with alleged modern "Keystone Instruments," which are in reality old instruments made by us years ago and purchased by them at second hand, they changing them in range and character to meet the requirements of their orders. These old Instruments are lacking in many of the improvements which make our modern line so desirable, and in addition have been botched in the change by lack of knowledge and facilities.

In view of this we desire to inform the public that every Instrument shipped from our factory is accompanied by a certificate duly signed, giving the serial number of the Instrument, its range and date of calibration.

We would warn the public to accept no Keystone Instruments unless accompanied by such a certificate.

Keystone Electrical Instrument Co.,

NINTH STREET AND MONTGOMERY AVE., PHILADELPHIA.

NEW YORK. BOSTON, CHICAGO.

The American Electric Meter Co.,

9th St. and Montgomery Ave., Philadelphia, Pa.,

Is now prepared to take orders for early delivery of all sizes of 3-Wire Constant Potential Registering Meters.

This meter is calibrated ready for instant use.
This meter requires no knowledge of electricity to erect.
This meter shows the load passing every instant.
This meter is hermetically sealed.
This meter measures correctly with uneven loads.
This meter can be calibrated with a watch in six minutes.
This meter requires no lubrication.
This meter is magnetically shielded.
This meter is direct reading, having no multiplier.
This meter does not require one-thousandth of a horse power.
This meter will operate for years without opening.
This meter has no springs, jewels or frictional errors.
This meter once right is always right.

Makes No Noise, Makes Money.

May we send our illustrated circular?

Economy of Labor is fully realized in the operation of a **Warren Alternator.** The fact that no attention is needed except to keep the oil reservoirs filled relieves the station management of the many annoyances and expenses incident to the running of other types of generators. Every part of the **Warren Alternator** is constructed for long, continuous runs and heavy duty.

A Large Supply

Carried in Stock.

WESTERN ELECTRIC CO.,
CHICAGO. NEW YORK.

New Transformer Lines

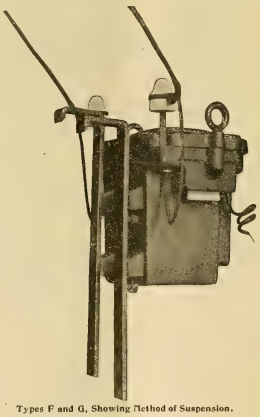
FOR 1898.

The Type G Extra High Efficiency.
The Type F High Efficiency.

Types F and G, without Attached Cut-Outs.

THE TYPE G.

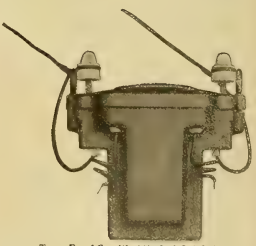
This line has been developed to meet the call for a better transformer, electrically and mechanically considered, for all day station service, than the market afforded. In this line "all day efficiencies" have been placed at a point competitors will find trouble in equaling for some time to come. In all considerations it is the "fin de siecle" transformer. Write for the Type G bulletin describing it in detail.



Types F and G, Showing Method of Suspension.

New Methods of Construction throughout. Improved Design from all Points of View.

Two Forms up to 5 K.W. Sizes, with and without Attached Cut-Outs.



Types F and G, with Attached Cut-Outs.

THE TYPE F.

The Type F displaces the well-known Type D, which has been this company's standard the last two years. It is the same transformer as the Type D in efficiency, core loss and regulation, and the same as the Type G in all mechanical features. Write for the Type F bulletin.

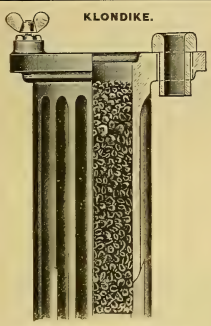
GOOD CARBONS MEAN LESS COST FOR CURRENT. Therefore, wherever a highly efficient service is desired, it is of the utmost importance to use the best Carbons obtainable.

"All the excellence in dynamos and arc lamps counts for but little, when poor Carbons are used in the lamps."

NOTICE.—The "Electra" Highest Grade Nuernberg Carbons are, as heretofore, manufactured by the world-renowned firm of C. Conradty of Nuernberg. See that every package of my Carbons bears the label with my trade-mark "Electra," and thus beware of imitations.
To protect the interest of purchasers of my Carbons, I am determined to proceed against infringers of my "Electra" trade-mark.



"KLONDIKE." No. 2 CELL.

(Patent Applied for.)

A GUARANTEE SHOULD MEAN SOMETHING; READ THIS:

"We will return a new cell, complete, in any case where corrosion is complained of in either the National No. 2 or the 'Klondike.'"

NATIONAL CARBON COMPANY,

600 Highland Ave., CLEVELAND, O.

IT IS FOLLY TO INSTALL GOOD MACHINERY

TO SUPPLY CURRENT TO POOR LAMPS, THE LAMP BEING **END, AIM** AND **TEST** OF THE LIGHTING SYSTEM. IF, HOWEVER, YOU ARE LOOKING FOR QUALITY IN YOUR **INCANDESCENT LAMPS** TRY THE

"HARDY."

SUSTAINED CANDLE POWER IS ITS STRONG POINT.

TO PROVE IT, WE WILL SEND YOU BY EXPRESS, CHARGES PREPAID, ONE DOZEN 16 C. P.,.3 or 3½ WATT LAMPS, ANY BASE, ANY VOLTAGE, FROM 45v. TO 125v. FOR $2.16; OR 200v. TO 250v. FOR $3.86.

HARDY INCANDESCENT LAMPS, HANGER BOARDS, COMPOSITE DYNAMO BRUSHES, SPARK ARRESTERS, AND COMMUTATOR COMPOUND.

PITTSFIELD, MASSACHUSETTS.

WESTERN REPRESENTATIVES: MEYSENBURG & BADT, 1504 MONADNOCK BLOCK, CHICAGO.

A NEW YEAR'S INCIDENT.

Special Dispatch—New York, January 1.—The many anxious friends and relatives of the passengers and crew on the little vessel "New Year '98," which, it will be remembered, has been a year overdue, and had been given up as lost owing to the terrible weather during its period of crossing, will be greatly relieved to know that this boat was sighted off Sandy Hook, New York, December 31, at 11:59 midnight. The bark is in a somewhat shattered condition, but Capt. McKinley reports that there was no material injury to the frame of the vessel and only its upper works were badly damaged, as shown in the illustration of the boat as it now lays on the beach. Now that the vessel is safe in port it will be called to mind that when it was first rumored that the "Ninety-Eight" was lost it was noised about that the owners had, before appointing its present master, hesitated over the appointment of Capt. McKinley. This hesitancy was due largely to the latter's pronounced belief as to the exact location of "Gold Island" in Trade Ocean, and the possible danger due to such uncertainty. A number of passengers, however, with some nautical training, who came over in the "New Year '98," are now convinced from personal observations of Gold Island, that this Island is literally "built on a rock" and has a foundation sufficient to support the "weight of the nation," so to speak. The owners of the "New Year '98" are therefore inclined to be much pleased with Capt. McKinley's work and many have assured him personally—on top of congratulations on his success with a dangerous task—that his present command will be secured for at least three more voyages and perhaps longer. The "New Year '98" will be entirely refitted before starting on the return voyage and will carry a large cargo of "Armorite" conduit.

Any child can see the point!

It's so simple!

ARMORITE INTERIOR CONDUIT CO.

PITTSBURG, PA., U.S.A.

A "Candle" may be a "Candle"—
and all that—
But some are made of beeswax,
and some are made of fat!

The above is merely a homely way of telling you that some arc lamps are a great deal better than others. Following are some most excellent reasons why the Jandus Arc Lamp is the best. These reasons are quoted bodily from the report of the Franklin Institute awarding to Wm. Jandus, patentee of the Jandus Enclosed Arc Lamp, the John Scott medal:

"The practical advantages of this lamp are:

"First.—That it can be used singly between mains of any ordinary direct incandescent circuit with comparatively little waste of energy.

"Second.—That the life of the carbons being so long, the lamp requires trimming only at long intervals; after certainly not less than 150 hours, thus showing a great economy in labor and carbons, this being about twenty times the life of a carbon in arc lamps now generally in use.

"Third.—The construction of the lamp is of an extremely simple character, with no complication of parts and with little liability to get out of order.

"In view of these facts, the Franklin Institute recommends the award of the John Scott Legacy Premium and Medal to William Jandus for his improved arc lamp adapted to incandescent circuits.

"Adopted at the stated meeting of the Committee on Science and the Arts, held Wednesday, May 1, 1895.

"(Signed) Jos. M. Wilson, President.
Wm. H. Wahl, Secretary.
"(Countersigned) Samuel Sartain, Chairman."

THE

Standard "Jandus"

150 Hour Enclosed
Arc Lamp,
Inside Service.

Mechanically and Electrically without an equal.

Constant Potential,
Constant Current,
Alternating,
220 Volt,
Railway
Short Types.

Used by more than 150 Central Stations.

Prospective buyers of Arc Lamps should bear in mind the following important facts:

The standard "Jandus" 150 hour arc lamp is the same as that formerly sold as the "Manhattan." The Jandus Electric Co. is the **sole owner** of the patents of William Jandus and the **sole manufacturer** of the 150 hour enclosed arc lamps made under these patents and heretofore sold as "Manhattan."

The "Jandus Electric Co." is the **sole selling agent** for the "Jandus" (formerly known as the Manhattan) 150 hour arc lamp.

Address all inquiries regarding the "Jandus" (formerly known as the "Manhattan") 150 hour enclosed arc lamp, to our Cleveland or Chicago office. Catalogue.

The Jandus Electric Co.

Chicago Office: 753 Monadnock Building. Factory and Main Office: Cleveland, Ohio.

THE MONTAUK MULTIPHASE CABLE.

BORN TO THE PUBLIC WITH THE GREATER NEW YORK.

A WONDERFUL INTERIOR ELECTRIC CABLE, constructed upon a NEW PRINCIPLE, STANDARDIZED for and ADAPTED TO ALL ELECTRIC WORK, and is the ONLY COMBINED AUTOMATIC FIRE AND BURGLAR CABLE IN THE WORLD. It is INFALLIBLE IN ACTION and CONTINUOUSLY THERMOSTATIC. It INSTANTANEOUSLY announces fires in their INCIPIENCY, when in contact with DANGEROUS HEAT OR THE SMALLEST FLAME.

THE MONTAUK MULTIPHASE CABLE is constructed for use in place of plain or insulated wire, which performs only SPECIFIC WORK; this cable has ALL of the NECESSARY ELECTRIC WIRES OR CONDUCTORS needed for all interior electric adaptations.

The DIFFERENCE, however, between THIS CABLE and the wires now in use is, that EVERY INFINITESIMAL PART of the cable is ALIVE to the approach of dangerous heat or flame, and capable of giving automatic warning thereof to all desired points, while WIRES as installed to-day are DEAD to the existence of heat or flame, and INCAPABLE of conveying information of danger EVEN IF BEING ENTIRELY CONSUMED BY FIRE.

Therefore the use of THIS CABLE in place of wires to connect thermostats and other heat-detecting devices, and for other various kinds of electric work, will enable ALL firms installing such Systems to give to their Customers increased Electrical Service in same installation and A PROTECTION AGAINST LOSS BY FIRE HERETOFORE UNKNOWN.

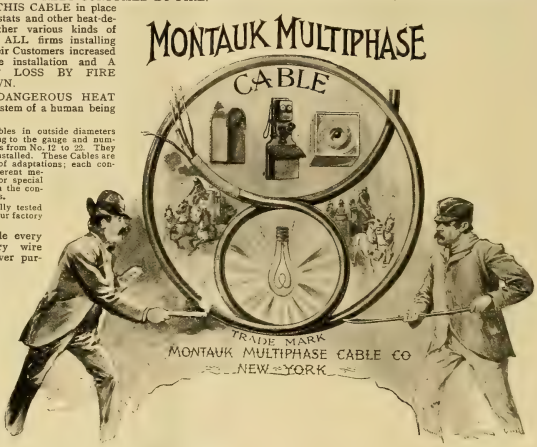
It is as sensitive to DANGEROUS HEAT OR FIRE as the nervous system of a human being is to the touch of flame.

We manufacture these Cables in outside diameters of ⅛ of an inch upward, according to the gauge and number of the conductors, and in sizes from No. 12 to 22. They are small, flexible, and easily installed. These Cables are made in decorative and waterproof adaptations; each conductor of the Cable is of a different metallic color, therefore no testing or special marks are required to distinguish the conductors when making connections.

All of our Cable is carefully tested by an experienced electrician at our factory and guaranteed perfect.

By the use of this Cable every infinitesimal part of every wire hereafter installed for whatever purpose in all buildings, is made a detective point for the discovery and automatic notification of danger from fire.

WE CONFINE OURSELVES TO THE MANUFACTURE AND SALE OF THIS CABLE FOR OTHERS TO INSTALL.



We invite every Central Station (Telephone, Telegraph, Fire Alarm, Burglar Alarm, District Service) and other Managers of Electrical Companies, also Contractors and Electricians generally, to send for our published literature, viz.: An elaborate and beautifully illustrated Catalogue, describing in detail the various features of work to which the Multiphase Cable may be adapted; also "Facts for Electricians," "Descriptive Circulars," "Schedule for Installations, Rentals, etc.," and "Price Lists;" mailed free upon application; or to give us a personal call for the purpose of making themselves acquainted with the great merits of this Cable. We also publish "The Montauk Multiphase Cable-Contractor's Hand Book," showing all "fire danger lines."

We own the sole and exclusive right to manufacture and sell the Montauk Multiphase Cable and Central Station Controller, by virtue of the following patents: No. 546,261 Sept. 10, 1895; No. 546,262, Sept. 10, 1895; No. 565,053, Aug. 4, 1896; No. 565,178, Aug. 4, 1896; No. 565,185, Aug. 4, 1896; No. 565,217, Aug. 4, 1896; No. 565,410, Aug. 4, 1896; No. 594,084, Nov. 23, 1897; No. 594,247, Nov. 23, 1897; No. 594,281, Nov. 23, 1897, which broadly cover not only the method of manufacturing, but the basic principle upon which these cables are constructed.

A GOOD THING!

"CLEANOR."

THE MOST EFFECTIVE CLEANER EVER PUT ON THE MARKET. Indispensable for cleaning Street Cars, Telephone Boxes and other electrical or other woodwork. A boon for car station managers. Used extensively by Street Railway Companies, Hotels, Theaters and Furniture dealers for renovating. Makes woodwork and furniture look like new, and **Does it Without Rubbing.** Removes dust, dirt, grease and oil, leaving the finish as fresh as the day it was put on. No trouble to use it. No water to splash around and drip, and does the work quickly and easily. The only preparation that leaves the finish absolutely clear and unclouded. **If your dealer does not handle it, write us direct.**

A VALUABLE NEW WORK.

ELECTRICIANS' HANDY-BOOK

OF USEFUL INFORMATION.

Edited by A. E. WATSON, A. M., Teacher of Electricity, Brown University, Providence, R. I.
Compiled by E. T. BUBIER. 2d.
ILLUSTRATED.

A Compilation from the works of Sylvanus P. Thompson, Kapp, Allsop, Munroe and Jamieson, Watson, Bottone, Bonney, Watt, Poole, Trevert, Haskins, Norrow and Reid, and others.

This book gives a large number of receipts for making Battery Fluids, Battery Pastes, Insulating Materials and Varnishes, Electro-Plating Solutions, etc. Tells how to make Electric Batteries, Bells, Telephone, Motors, Dynamos, Induction Coils, Influence and Static Machines, etc. Gives formulæ for winding Dynamos, Motors, Armatures, Field Magnets, Transformers. Contains many Rules, Tables, Data, etc. In fact it is almost a complete cyclopedia of Electricity. It is neatly bound and of a convenient size to be carried in the pocket for handy reference.

CONTENTS.

PART
1. History.
2. Theory.
3. Measurements. (Electric and Magnetic.)
4. Electric Batteries.
5. Electro-Chemistry and Metallurgy.
6. The Telegraph and Telephone.
7. Dynamos and Motors.
8. Management of Dynamos and Motors.

PART
9. Electric Lighting.
10. Transformers.
11. Wiring for Electric Power.
12. Wiring for Bell Fitting and Gas Lighting
13. Electric Railways.
14. Miscellaneous.
15. Useful Tables.
16. Logarithms.

Contains over four hundred and fifty pages and many illustrations.

PRICE, CLOTH, ONLY $2.50; POSTPAID.

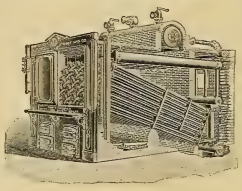
This Is the Boiler

Root Improved Water-Tube Boiler.



Selected by leading Electric Light Plants and Street Railway Companies throughout the United States. The following are the acknowledged requirements in water-tube boilers: **Straight tubes which can be thoroughly inspected and cleaned inside and outside; perfect suspension, allowing free movement of whole boiler expanding and contracting; perfect flexibility for the difference in expansion between upper and lower tubes; interchangeable parts built to fit standards; facilities for making quick and easy repairs which can be done by your own engineer or machinist; a cover joint which can easily be made tight, and frequently broken and replaced without injury; provision made to introduce the feed water where it will not chill and moisten the steam; provision made to carry feed-water impurities direct to the mud drum and not past the ends of the tubes; provision made to supply the lower tubes with a bountiful supply of cool water; the use of the best materials and fittings the market can afford; the best possible workmanship; a large disengaging surface for the steam to escape from the water; small cast-iron pressure parts; ample heating surface to prevent injury to parts should boiler be forced above its rating.**

EXAMINE THESE POINTS IN THE IMPROVED ROOT WATER-TUBE BOILER.

THE McCORMICK TURBINE.

On Vertical or Horizontal Shaft, Especially Adapted for Electrical Work.

Gives more power per diameter with a higher percentage of useful effect than any other water-wheel heretofore made. All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with us, **as we are willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

S. MORGAN SMITH CO., York, Pa.

Estimates furnished for complete power plants and results guaranteed.

WATER WHEELS

For Heads of 3 Feet to 2000 Feet.

Especially adapted to all kinds of

ELECTRIC POWER AND LIGHTING PLANTS.

Recent tests at Holyoke, given below, enable us to guarantee: *The Largest Power ever obtained from a wheel of the same diameter. The highest speed ever obtained for the same power. The highest mean efficiency when running from half to full gate.* We guarantee also: *A runner of the greatest possible strength. A gate unequaled in quickness and ease of opening and closing.*

Test of a 48 in SAMSON, Jan. 25, 97. | Test of a 36 inch SAMSON, Feb 1, '97.

ORIGINAL AND SOLE MAKERS IN THE U.S.

A VALUABLE BOOK FOR ENGINEERS AND FIREMEN NOW READY.

MODERN EXAMINATIONS OF STEAM ENGINEERS or PRACTICAL THEORY EXPLAINED and ILLUSTRATED.

BY W. H. WAKEMAN.

12 mo. Cloth. 272 pages. 53 Chapters.

Containing a complete list of 300 questions such as will be asked of any Engineer when taking examination for U. S. Government or State License, all of which are fully answered in the text.

PRICE, $2.00

By mail, postpaid, to any part of the world

This book while especially adapted for engineers' examinations, is also intended as a practical guide to Engineers, Firemen, Boiler Makers, Machinists, and others, in daily practice.

The author being a practical steam engineer himself, well knows the wants of the working engineer, and has put into this work such knowledge and information as is best adapted to their use, making it altogether the most complete and comprehensive guide for the busy workers in the engine room, boiler works and machine shops that has ever been published.

As one engineer who has read the book says: "I think there are few engineers that it wouldn't do some good. It seems as if it was a review of all I have ever read, and a lot more besides."

The author has treated of a very great variety of subjects which are of vital importance to all who wish to improve and extend their knowledge of steam engineering, and has explained the rules and formulas given, in the simplest manner possible, and has worked out examples by them, so that all who can read may understand them.

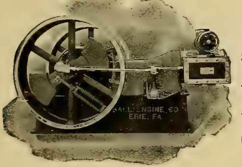
The 300 questions are an important feature of the book, they are entirely separate from the 53 chapters of reading matter, and were written after many years of practical experience and careful research by the author.

His connection with the Boardman Manual Training High School at New Haven, Conn., as Instructor in Steam Engineering, his 12 years of active membership in the N. A. S. E., and his position as Instructor of No. 10 of Conn., a sturdy branch of the National Organization, makes him especially competent in this part of the work.

The many flattering commendations which this book has already received from competent judges and high authorities, speak well for its value.

ELECTRICIAN PUBLISHING COMPANY, - - - Suite 510 Marquette Building, Chicago, Ill.

Features of Our Engines Worth Remembering:



1st—A symmetrical design with an intelligent, scientific distribution of metal, giving exceptional strength and perfect balance.
2nd—The only absolutely steam-tight valve, which automatically adjusts itself for wear, needing no outside attention.
3rd—"Rites governor system," which combines the greatest simplicity with most perfect regulation.
4th—Crank shaft forged open-hearth high-carbon steel, combining greatest strength, best wearing qualities and smoothest surface.
5th—Most complete automatic oiling system.

THE BALL ENGINE CO.,

Chicago Office, 1526 Monadnock Block. **ERIE, PENNSYLVANIA, U. S. A.**

FOOS Gas and Gasoline Engines EXCEL ALL OTHERS IN DESIRABLE FEATURES.

Adapted for ALL Power Purposes—Electric Lighting, Milling, Mining, Water Works, Elevators, Factories, etc. Cheaper and Better than Steam.

ELECTRICITY AND MAGNETISM.

325 PAGES. PRICE $2.00. 347 ILLUSTRATIONS. A series of Thirty-four Practical Lessons covering the Science of Electricity from Its Fundamental Principles to Its Every-day Applications. By Prof. D. C. Jackson, University of Wisconsin; Prof. H. S. Carhart, University of Michigan; Prof. B. F. Thomas, University of Ohio; Prof. Wm. A. Anthony, of New York; Prof. Brown Ayres, Tulane University; Prof. A. C. Perrine, Leland Stanford University, Cal.; Prof. Geo. D. Shephardson, University of Minnesota, and others. A Comprehensive Treatise in Simple Language, Free from Algebraic Equations and Easily Understood.

CONTENTS:

CHAPTER I: The Nature and Properties of Electricity; Origin of Electricity; Two Kinds; Laws of Attraction and Repulsion; Positive and Negative Charge; Terms, Conductors, Insulators, Electric Conductivity; Conveying Electricity; The Electroscope; Force Exerted Between Charged Bodies; Unit of Measurement of quantity of Electricity; Electrometer.—CHAPTER II: Machines for Generating Electricity by Friction and by Electric Induction; Making Machine to Continuously Generate Electricity by Friction; The Electrophorus; Induction Generator; Units of Electric Current and Pressure; Electricity Conveyed by Unit Current Each Second; Negatively and Positively Charged Conductors; Relation of Lightning and Sparks of Electrical Machine.—CHAPTER III: Electric Batteries or Appliances for Generating Electricity by Chemical Action; Action of Batteries; Electric Pressure; Voltaic Electricity; Direction of Current Flow; Production of Continuous Current; Battery Cells in Series; Production of Pressure by Cells; Polarization and Its Avoidance; Leclanche Cell; Open Circuit Cells. —CHAPTER IV: Electric Batteries or Appliances for Generating Electricity by Chemical Action (Concluded); Closed Circuit Cells; Local Action; Law of Electro-chemical Action; Electro-chemical Equivalent; Primary Batteries Compared with Dynamos for Furnishing Current; Uses of Batteries; Difference Between a Primary and Storage Battery; How Storage Batteries are Made; Parallel Connection of Plates in Storage Batteries.—CHAPTER V: The Nature and Properties of Magnetism, Magnetic Fields; Permanent Magnetism; Magnetic Attraction and Repulsion; Poles of Magnet; Magnitude of Force Between Two Magnets; Aging Magnets; Earth's Action on Magnetic Needle; Magnetic Field; Action of Lines of Force.—CHAPTER VI: The Magnetic Effects of Electric Currents and Magnetic Circuits; Effect of Electric Current on Magnetic Needle; Relation Between Direction of Lines of Force and Direction of Current Flow; Determination of Current Direction by Compass; Ampere Turns; Solenoids; Ampere's Theory; Solenoids with Steel or Iron Cores; Residual Magnetism; Electro-Magnets; Magnetic Permeability; Magnetic Reluctance; Magneto Motive Force or Magnetic Pressure.—CHAPTER VII. Ohm's Law of the Flow of Electricity; Pressure; Resistance; Current; Volt; Ohm; Ampere; Mercury Resistance; Conductivity of Copper Compared with Other Metals; Resistance of Circuits Made Up of the Same Parts in Parallel; Joint Resistances; Fall of Voltage Over Resistance; Effect of Temperature on Resistance; Copper Temperature Coefficient.—CHAPTER VIII: Heating Effects of Electric Currents; Miscellaneous Effects of Electric Currents; Foot-pound; Joule; Horse-power; Watt; Kilowatt; Watts per Horse-power; Heating Effects on Bearings of Machinery; Effect of Electricity on Nerves of Animals; Muscular Effect of Strong Currents.—CHAPTER IX: Galvanometers and Voltameters; Differences in Construction for Large and Small Currents; Presence and Direction of Currents Shown by Galvanometer; Strength of Current Indicated; Tangent Galvanometer; Reflecting Galvanometer; Needle Suspension; d'Arsonval Galvanometer; Terms "Dead-Beat," "Calibrate;" Voltameter; Electrolyte, Electrolysis; Electrode; Forms of Voltameters.—CHAPTER X: Measurement of Electrical Resistance; Resistance Measured by Substitution; Resistance Boxes; Use of German Silver; Coils; Wheatstone Bridge; Measuring Resistances with Bridge; Measuring Very High Resistances; Practical Examples.—CHAPTER XI: Every-day Measurements of Electric Currents and Pressure; Three Effects by Which Currents are Directly Measured; Amperemeters; Milliampere; Microampere; Three Classes of Magnetic Amperemeters; Weston Amperemeter; Electro Dynamometers; Hot Wire Instruments; Scales of Amperemeters; Alternating Current Measuring Instruments; Measuring Very Large Currents; Measuring Electric Pressures; Voltmeters; Cardew Voltmeter; Electrometers; Electrostatic Voltmeters; Standard Cells; Measuring Currents by Voltmeter and a Standard Resistance.—CHAPTER XII: Every-day Measurements of Electric Power, Condensers and The Measurement of their Capacity; Wattmeters; Electrodynamometer Used as Wattmeter; Recording Wattmeters; Coulomb Meters; Watt Hour; Ampere Hour; Capacity; Farad; Microfarad; Condenser; Capacity of Condenser; Charging Condenser; Specific Inductive Capacity; Selection of Insulation for Telephone Cables; Capacity of Underground Wires; Comparing Capacities by Ballistic Galvanometer; Practical Capacity Measurements; Leyden Jar.—CHAPTER XIII: Electrolytic Deposition of Metals; Electroplating; Metals Commonly used in Plating; Salt of a Metal; Nitrate of Silver; Cyanide of Silver and of Potassium; Solution for Silver plating; Vats; Quality of Electrolytic Deposit; Effect of Too Great or Small Currents; Cleaning Articles to be Plated; Gilding Inside of Silver Articles; Base Metals on Which Nickel is Usually Plated; Solution for Nickel Plating; Electrotyping; Electrotype Molds; Electrotype Finishing; Electrolytic Refining of Copper; Solution Used.—CHAPTER XIV: The Electric Telegraph; Elements of Electric Telegraph; Telegraph Circuits; Telegraphic Signals; Sending and Receiving; Telegraph Lines; Sounder; Relays; Local Circuits; Multiple Telegraphy; Duplex Telegraphy; Diplex Telegraphy; Quadruplex Telegraphy.—CHAPTER XV: Multiple Telegraphy; Differential Relay; Polarized Relay; Pole Changer; Principles of Operation of Diplex, Quadruplex, Bridge Duplex; Artificial Line; Autographic Telegraphy.—CHAPTER XVI: The Telephone; Bell Telephone; Microphone; Blake Transmitter; Exchanges; Switchboard; Long-Distance Transmitter.—CHAPTER XVII: The Construction of Telegraph and Telephone Lines and Instruments; Poles; Cross-Arms; Pins; Joints; Insulators; Insulation; Ground Plates; Underground Cables; Conduits; Fuses; Multiple Switchboards.—CHAPTER XVIII: Testing Lines for Insulation and Conductivity and the Location of Leaks and Breaks; Line Troubles; Grounds; Crosses; Locating Trouble; Earth Currents; Line Conductivity and Insulation; Testing.—CHAPTER XIX: Principles of Continuous Current Dynamos and Motors; Electric Conductor in Magnetic Field; Field Strength; Induced Electric Pressure; Direction of Current Moving Conductors; Alternating Current; Dynamos; Magnetos; Commutator.—CHAPTER XX: Principles of Continuous Current Dynamos and Motors; their Construction, Care and Attendance; Gramme Armature; Siemens Armature; Armature Current; Laminating Cores; Foucault or Eddy Currents; Hysteresis; Fundamental Principles of Dynamos and Motors; Points of Good Dynamo; Counter Electric Pressure; Types of Field Windings; Series, Shunt and Compound Wound Machines; Multipolar Machines; Regulation, Care and Maintenance.—CHAPTER XXI: Arc Lighting and Arc Light Machinery; The Arc; Arc Lamps; Principles of Operation; Connections; Arc Dynamos; Current and Pressure Required; Making of Arc Carbons; Regulators; Arc Light Switchboards.—CHAPTER XXII: Incandescent Lighting and Power Transmission, Two, Three and Five Wire Systems of Distribution for Electric Lights and Motors; Incandescent Lamp; Filaments; Vacuum; Material for and Making of Filaments; Advantages of Incandescent Lamps; Incandescent and Motor Circuits; Constant Pressure; Loss of Voltage; Circular Mils; Practical Examples; Weight of Copper Required for Transmission of Power at Different Pressures; Three-Wire System; Motor Starting Resistances.—CHAPTER XXIII: Construction of Electric Light and Power Circuits, and Their Testing; Overhead Electric Light Wires; Weather-Proof Wire; Arc Circuit Wires; "Drawing In" and "Built In" Underground System; Underground Electric Light Cables; Edison Tubing; Feeders; Mains; Inside Wiring; Cleat Work; Moulding Work; Concealed Work; Dangers from Fires; Distribution System;.—CHAPTER XXIV: Testing Electric Light Circuits and the Distribution and Measurement of Light; Faults; Soldered Joints; Magneto Bell; Use of Voltmeter to Locate Grounds on Arc Circuits; Ground Detector; General Testing; Photometer; Standard Candles; Illuminating Effect of Lamps; Effect of Opal Globes.—CHAPTER XXV: Electro-Magnetic Induction; Effect of Cutting Lines of Force by an Electric Conductor; Induced Currents; Induction Coils; Cores of Induction Coils; Transformers; Direction of Induced Current; Self Induction; Attraction and Repulsion of Parallel Wires Carrying Currents.—CHAPTER XXVI: Alternating Currents; Alternator; Electrolytic Effect of Pulsating Current; Heating Effect of Alternating Current; Effective Value; Alternating Current; Measurements; Frequency; Period; Apparent Resistance. —CHAPTER XXVII: Alternating Currents and Alternating Current Machinery (Concluded); Power Used in Alternating Circuits; Alternating Currents for Lighting; Making Transformers; Testing Transformers; Building Alternators; Number of Alternations; The Exciter; Running Alternators in Parallel; Synchronous Motors; Two-Phase and Three-Phase Systems; Induction Motors; Squirrel-Cage Armature; Mesh Connection; Star Connection;.—CHAPTER XXVIII: Miscellaneous Applications of Electric Motors; Uses of Electric Motors; Motors in Machine Shops; Waste of Power in Factories; Advantages of Removing Shafts and Belts; Estimating Electrical Power Required; Electric Elevators; Electric Launches.—CHAPTER XXIX: Electric Railways; Richmond Electric Railroad; Trolley Wire; Trolley; Track; Use of Two Motors; Rail Bonds; Heavy Electric Locomotives.—CHAPTER XXX: Methods of Handling and Controlling Railway Motors and Generators; Output Records; Recording Voltmeters; Load of Electric Railway Plant; Application of Storage Batteries to Smooth Road Curve; Methods of Controlling Street Car Motors; Station Instruments; Equalizer.—CHAPTER XXXI: Model Electric Plant; First Central Station; Changes in General Mechanical Construction of Dynamos; Instruments; Multiple Arcing Galvanometers; Use of Double and Single Pole Switches; Operating Dynamos in Parallel; Feeder Connections in Continuous and Alternating Stations; Throwing Dynamo into Circuit; Cutting Dynamo Out.—CHAPTER XXXII: Underwriter's Rules, Etc.; Necessity of Rules; Special Points in Wiring; Insulation of Sockets, Fuses, Fixtures; Annunciator Wire; Office Wire; Leaky Wires.—CHAPTER XXXIII: Electric Welding, Forging, Etc.; Electricity Applied to the Kitchen; Electrical Methods Applied to Metal Working; Thomson Apparatus for Heating Metals; Welding by Thomson Method; Bernardos Process of Working Metals; Bringing Piece of Metal to High Temperature by Dipping in Pail of Water; Electric Current for Warming and Cooking, Electric Heating and Stoves Compared.—CHAPTER XXXIV: Electro-Therapeutics; Galvanic Current; Faradic Current; Static Electricity; Electric Osmosis; Electro-Cautery; Medical Electric Lights.

PRICE $2.00. Sent postage prepaid to any address in the world on receipt of price. The Ideal Work for Electricians, Central Station Men, Engineers, Dynamo Tenders, Linemen, Students, Etc.

New Transformer Lines

FOR 1898.

The Type G Extra High Efficiency.
The Type F High Efficiency.

Types F and G, without Attached Cut-Outs.

THE TYPE G.

This line has been developed to meet the call for a better transformer, electrically and mechanically considered, for all day station service, than the market afforded. In this line "all day efficiencies" have been placed at a point competitors will find trouble in equaling for some time to come. In all considerations it is the "fin de siecle" transformer. Write for the Type G bulletin describing it in detail.

Types F and G, Showing Method of Suspension

New Methods of Construction throughout. Improved Design from all Points of View.

Two Forms up to 5 K.W. Sizes, with and without Attached Cut-Outs.

Types F and G, with Attached Cut-Outs.

THE TYPE F.

The Type F displaces the well-known Type D, which has been this company's standard the last two years. It is the same transformer as the Type D in efficiency, core loss and regulation, and the same as the Type G in all mechanical features. Write for the Type F bulletin.

STEEL BOXES.

STEEL SPLIT BOXES FOR 5-8 CONDUIT.

NOTE the good points of this box!
NOTE that it is non-breakable!
NOTE the length of the projecting lugs!
NOTE that the inner rim of outlet is smaller than the outer!
NOTE from this that the conduit cannot run too far into box!
NOTE the removable discs!
NOTE that it weighs but 21 ounces!

If you have noted well all these good points you will have discovered the Best Split Conduit Box on the Market. Our new Catalogue "D" will tell you about our other 1,200 styles of Steel Outlet Boxes. We also manufacture Steel Boxes for Panel Boards.

IT IS FOLLY TO INSTALL GOOD MACHINERY

TO SUPPLY CURRENT TO POOR LAMPS, THE LAMP BEING **END, AIM** AND **TEST** OF THE LIGHTING SYSTEM. IF, HOWEVER, YOU ARE LOOKING FOR QUALITY IN YOUR **INCANDESCENT LAMPS** TRY THE

"HARDY."

SUSTAINED CANDLE POWER IS ITS STRONG POINT.

TO PROVE IT, WE WILL SEND YOU BY EXPRESS, CHARGES PREPAID, ONE DOZEN 16 C. P., 3 or 3½ WATT LAMPS, ANY BASE, ANY VOLTAGE, FROM 45v. TO 125v. FOR $2.16; OR 200v. TO 250v. FOR $3.86.

AGENTS WANTED. CORRESPONDENCE SOLICITED.

THE K. & W. COMPANY,

MANUFACTURERS OF

HARDY INCANDESCENT LAMPS, HANGER BOARDS, COMPOSITE DYNAMO BRUSHES, SPARK ARRESTERS, AND COMMUTATOR COMPOUND.

PITTSFIELD, MASSACHUSETTS.

WESTERN REPRESENTATIVES: MEYSENBURG & BADT, 1504 MONADNOCK BLOCK, CHICAGO.

To Accommodate Our Large Increase in Business

WE HAVE **REMOVED** TO

Commerce St., Corner of Seventh.

EYANSON & ARMPRIESTER,

FORMERLY (J. GRANT HIGH & CO.) Philadelphia.

Makers of Knife Switches and Switchboards.

HAVE YOU A COPY OF OUR CATALOGUE "D"?

Perfection Drop Elevator Annunciators.

NEVER FAIL TO WORK.

Are not affected by jars.

Freight allowed to Chicago on all orders.

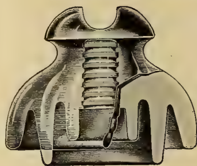
PRICES RIGHT FOR QUALITY.

Star Electric Company,

279 Front St., Binghamton, N. Y.

High Potential Insulators

IN GLASS AND PORCELAIN.



Will carry any current up to 50,000 volts. Used on the Niagara Falls and Buffalo Transmission lines.

Insulators for High Voltage Power Transmission, Electric Railway, Electric Light, Telegraph and Telephone Lines.

Send for Catalogue.

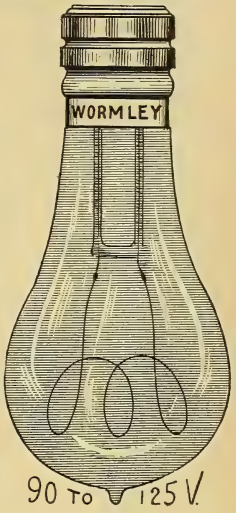
READ REPORT OF TEST BELOW MADE BY A MOST RELIABLE CONSUMER AND SAY, CAN WE FURNISH HIGH EFFICIENCY LAMPS WITH LIFE?



AN ABSOLUTELY FIRE PROOF HOTEL.

The VIRGINIA HOTEL.
RUSH & OHIO STREETS
CHICAGO.

January 18th. 1898

Jas. C. Wormley & Co.,
Marquette Bldg.,
Chicago.

Gentlemen:-

We have now finished test on the "Wormley" lamps which I took from your shipment of October 29th and, as per your request, give you copy of our record herewith:

Intial test Oct. 31st. '97.

Volts.	Av.C.P.	Av.Watts per lamp.	Av.Watts per C.P.
110	16	47-19/100	2-94/100

Average life 922 hours.

It is needless to say we are greatly pleased with your lamps.

Yours truly,

W. T. Kinman

Chief Engineer.

A VERY LITTLE STORY (with a very big moral!)

"Oh, Brutha, why does the 'Big Bird' hurt the 'Little Frog'?"

"Ah, Sista, don't you know? Because the Little Frog got in the Big Bird's way and croaked so the Big Bird had to eat up the Little Frog! and of course the Little Frog didn't like it."

"Of course not, Brutha."

A GOOD THING!

"CLEANOR."
THE MOST EFFECTIVE CLEANER EVER PUT ON THE MARKET. Indispensable for cleaning Street Cars, Telephone Boxes and other electrical or other woodwork. A boon for tidy station managers. Used extensively by Street Railway Companies, Hotels, Theaters and Furniture Dealers for renovating. Makes woodwork and furniture look like new, and Does it Without Rubbing. Removes dust, dirt, grease and oil, leaving the finish as fresh as the day it was put on. No trouble to use it. No water to splash around and drip, and does the work quickly and easily. The only preparation that leaves the finish absolutely clear and unclouded. If your dealer does not handle it, write us direct.

"To Selling Agencies:"

A new company recently organized, and at present engaged in equipping extensive and modern works for the manufacturing of a large line of new and improved machinery for heavy steam plant work, desire to open correspondence with selling agencies and dealers of experience in Water Tube Boilers, Engines or Electrical Machinery, who are desirous of either adding to their present business or of making changes looking to more profitable connections. Everything offered by this company will be a distinct advance in efficiency and general merit over anything on the market, and the new feature by which such ends are attained will be entirely original. Fullest investigation is solicited.

AMERICAN ELECTRICAL ENGINEERING ASSOCIATION,

TELEPHONE AND ELECTRICAL ENGINEERS

21 Quincy St., Chicago, Ill.

THE TELEPHONE HAND-BOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price $1.00.

EXTRACT FROM PREFACE.

The title book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book as to the working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with recent inventions, the apparatus and processes used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice, and most of the apparatus and methods described are peculiar to or have originated in this country.

No book of any practical interest is the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it without the assistance of a telephone worker and manager. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Contact Batteries. Electromagnetic Induction.
6. The Induction Coil. Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magneto Telephones.
9. The Bell Telephone Receiver.
10. Other Forms of Magneto Telephones.
11. The Gower, Ader and D'Arsonval Receivers. Mercadier's Bi-Telephone.
12. The Siemens Kotyra Neophone and Pocket Set.
13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction.
28. Metallic Circuit.
29. Underground Wires.
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser; Its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony

The Lockwood Transmitter

Is protected by letters patent No. 528640 and No. 557588, issued Nov. 6, 1894, and April 7, 1896, respectively.

The electrodes have "A variable air space" between them, and the adjustment is obtained by tension instead of pressure. The Lockwood is positively the only Transmitter on the market having no contact BETWEEN electrodes, consequently parties liable to infringement suits and promoters of long-distance systems will find it to be the only telephone that will satisfy the fears of their subscribers. The Transmitter can be placed upon any instrument now in use, and an exchange of Transmitters is easily effected.

AGENTS WANTED IN LEADING CITIES.

A Great Railway The Chicago, Milwaukee & St. Paul Railway company owns and operates 6,151 miles of road. It owns and operates its own Sleeping Cars and Dining Cars, and its service is first-class in every respect. It traverses the best portion of the States of Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota and North Dakota. It runs vestibuled, electric-lighted trains between Chicago, St. Paul and Minneapolis, and between Chicago and Omaha and Sioux City, and solid trains between Chicago and Kansas City. Also through sleeping cars and coaches between St. Louis and Kansas City and St. Paul and Minneapolis, daily, via the Hedrick Route. It has the absolute block system. It uses all modern appliances for the comfort and safety of its patrons. Its train employes are civil and obliging, and its General Passenger Agent asks every man, woman and child to buy tickets over the Chicago, Milwaukee & St. Paul Railway—for it is A Great Railway.

HART SWITCHES.

"Nothing succeeds like success." Hart Switches have been manufactured since 1890. Each year our sales have grown larger. Each year we have made some improvement in quality. Our Switches to-day are better and sales larger than ever before. We build for active service---not for the bargain counter and scrap heap. A chain is no stronger than its weakest link. Switches are links in electric circuits. A defective or poorly constructed switch is worse than worthless---it is a constant source of danger, annoyance and expense. Make your next order read "HART" Switches and you will be well pleased with value received. Your dealer carries a full stock of Hart Switches and can ship without delay.

A TECHNICAL EDUCATION 50 CENTS A WEEK.

The new installment plan of The International Correspondence Schools, Scranton, Pa.—the largest and most successful correspondence teaching institution in the world—places an education within the reach of all. Students may enroll upon paying $2 in advance, the balance to be paid at the rate of $2 a month. The charges are moderate and include all necessary textbooks. Studies are carried on at home without loss of time from work.

The Electrical Power and Lighting Scholarship is a thorough course of instruction in the installation, care and operation of electric light, power and railway plants, designed to meet the wants of busy men who desire to put into actual practice as soon as possible the information they acquire.

The Mechanical-Electrical Scholarship includes instruction in mechanical and electrical engineering and is intended especially for those who wish to become designers of electrical machinery.

Also 41 courses including Steam Engineering, Mechanics, Drawing, Machine Design, Civil Engineering, Bookkeeping, Shorthand and English branches.

Write for circular stating subject in which you are interested.

Westinghouse Machine Co., Manufacturers.

Westinghouse, Church, Kerr & Co., Engineers.

WITH natural draft, high chimney temperatures are a necessity, for it is the high temperature of the flue gases alone that produces the draft. But high flue temperatures mean waste of fuel, and high chimneys are themselves expensive. The user of natural draft is therefore between the two horns of a dilemma. If he avoids excessive chimney wastes he fails to get up steam, and if he pushes his furnaces so that the boilers steam satisfactorily, he loses inordinately through the stack. There is, however, a way out of both difficulties, viz.: By doing away with the expensive stack and producing draft by mechanical means.

This system has been applied to hundreds of thousands of horse power of boilers with resulting economy, and it is worth your while to look into the matter if you are making or using steam. If you are interested address

NEW YORK, 26 Cortlandt St. BOSTON, 53 State St. PITTSBURG, Westinghouse Bldg.
CHICAGO, 171 La Salle St. DETROIT, Union Trust Bldg. PHILADELPHIA, M. R. Muckle, Jr., & Co., Drexel Bldg.

Why are the greatest Electrical Undertakings awarded to us? Because the name of Westinghouse is a guarantee. Because it leads in electrical work. Because it means success. Because our experiments are made in our shops, and not on our customers. Everything electric.

SCIENCE.

Where Is a Man Without Science?

Dearborn Laboratories.

The only Laboratories ever opened, accessible to the engineer. Open, free and at the service of any steam engineer looking for a little knowledge or friendly advice from a chemist's standpoint. The only company that has ever spent their money liberally to educate the engineers. The only company who take pleasure in making all analytical determinations of water, incrustations, oils, coal, everything for the steam engineer, free, to help him, to elevate him, to put him in a position where he can go and get thorough scientific knowledge to enable him to cope with the arguments put forth by his enemies or the common market. The only company honestly making scientific VEGETABLE boiler compounds, according to "EDGAR'S METHODS AND PROCESSES," using the pure tannin extracts which are known and determined to be free from all volatile oils or other oxidizing agents, blended with elm and other starches to convert the scale forming carbonates into non-scale forming TANNATES, and mixing and blending SUGARS into these compounds to convert the scale forming and deleterious sulphates into non-scale forming and harmless saccharates, oxalates, tartrates of lime and a complex mixture of such, which readily washes out with the water. These processes are all protected and handled by this company only. The ingredients must all be handled and made from the crude materials, which is so expensive that ordinary firms cannot dip into this subject without an immense outlay of capital. You do not want to use a mixture of tannins on sulphate waters, nor a mixture of sugars on carbonate waters. Waters all differ. How are you going to tell what to do without first analyzing the water and diagnosing the case, and then, after so doing, you haven't an excess or deficiency of any one of the antidotal ingredients, but get the true worth of every ounce of compound, as proportioned to meet the requirements of the water. Try it. Ask your neighbors what the DEARBORN COMPOUNDS are doing. Ask the mechanical press of the country about our LABORATORY and what we have put together, and if others have a LABORATORY on this subject.

Don't take everything for granted that you hear. Believe nothing without looking into the subject for yourself.

ELECTRICITY AND MAGNETISM.

A series of thirty-four lessons covering the Science of Electricity from its Fundamental Principles to its Everyday Practical Application. Comprises 325 pages, over 300 diagrams and illustraions. Price $2. By

PROF. D. C. JACKSON, University of Wisconsin.
PROF. B. S. CARHART, University of Michigan.
PROF. R. F. THOMAS, University of Ohio.
PROF. WM. A. ANTHONY, of New York.
PROF. BROWN AYRES, Tulane University.

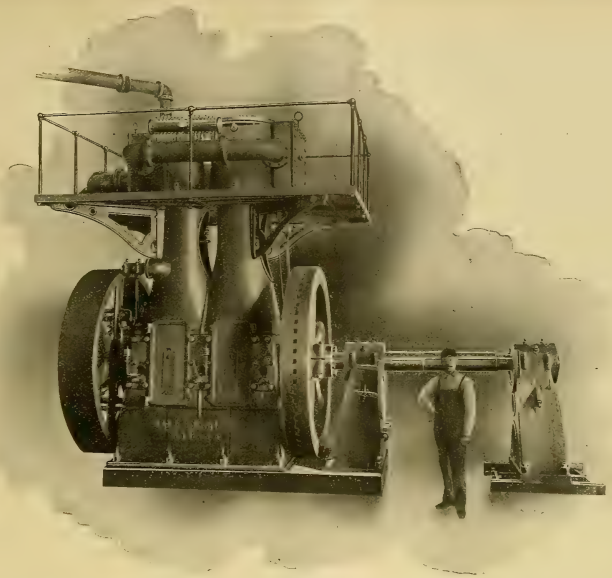
A Comprehensive Treatise in Simple Language, free from Algebraic Equations and Easily Understood. And others.

TABLE OF CONTENTS:

1. The nature and properties of electricity.
2. Machines for generating electricity by friction and by electric induction.
3. Electric batteries or appliances for generating electricity by chemical action.
4. Electric batteries or appliances for generating electricity by chemical action considered.
5. The magnetic effects of electric currents, magnetic fields.
6. The magnetic effects of electric currents, and magnetic circuits.
7. Ohm's law of the flow of electricity.
8. Heating effects of electric currents. Miscellaneous effects of electric currents.
9. Galvanometers and voltameters.
10. Measurement of electrical resistance.
11. Everyday measurements of electric currents and pressures.
12. Everyday measurements of electric power. Condensers and the measurement of their capacity.
13. Electrolytic deposition of metals.
14. The electric telegraph.
15. Multiple telegraphy.
16. The telephone.
17. The construction of telegraph and telephone lines and instruments.
18. Testing lines for insulation and conductivity and the location of leaks and breaks.
19. Principles of continuous current dynamos and motors.
20. Principles of continuous current dynamos and motors, their construction, care and attendance.
21. Arc lighting and arc light machinery.
22. Incandescent lighting and power transmission, two, three and five wire systems of distribution for electric lights and motors.
23. Construction of electric light and power circuits and their testing.
24. Testing electric light circuits, and the distribution and measurement of light.
25. Electromagnetic induction.
26. Alternating currents.
27. Alternating currents and alternating current machinery (continued).
28. Miscellaneous applications of electric motors.
29. Electric railways.
30. Methods of handling and controlling railway motors and generators.
31. Model electric plants.
32. Underwriters' rules, etc.
33. Electric welding, forging, etc.; electricity applied to the kitchen.
34. Electro-therapeutics.

SENT POSTAGE PREPAID TO ANY ADDRESS IN THE WORLD ON RECEIPT OF PRICE, $2.00.

ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG., CHICAGO.



The half-tone cut represents a CROSS COMPOUND VERTICAL ENGINE which we shipped to Russia not very long ago. We have received such a nice letter in regard to it that we think you would perhaps be interested in reading it:

BALL ENGINE CO., Erie, Pa. PITTSBURG, PA.

Gentlemen:—I am in receipt of a letter from Mr. H. S. Loud, General Manager of the Nicopol-Mariopol Mining & Metallurgical Company's works in South Russia, in which among other things he says: "The electric plant is working beautifully. You would be doing an almost obligatory service in thanking the Ball Engine people for me for the very great satisfaction which their machinery has given this company. The Ball Engine people were especially gracious in the prints, etc., sent, and their workmanship is magnificent."

I take pleasure in advising you of Mr. Loud's appreciation of your machinery.

Yours truly, JULIAN KENNEDY.

You see the engine is doing its own talking, which is better than anything we can say. We believe you will agree with us that the design is good and that it ought to do good work, and it does.

One great advantage of this engine over others is the ability to get at the shaft, or make adjustments without having to take the whole engine down.

We would mention some users of our vertical engines:

Elgin Street Railway Co., Elgin, Ill.; Apollo Iron & Steel Works, Vandergrift, Pa.; Shoenberger Steel Works, Pittsburg, Pa.; Claus Spreckles Building, San Francisco, Cal.; Detroit Free Press Building, Detroit, Mich.; Edison Light & Power Co., Erie, Pa.; Los Angeles Street Ry. Co., Los Angeles, Cal. Camden Horse Railroad Co., Camden, N. J.; Nicopol-Mariopol Mining & Metallurgical Co., Russia.

We are at the present time installing four of them in the Chicago Public Library, and are building two for the Horne Building, Pittsburg, Pa., and one for the Brooklyn Navy Yard.

Our horizontal engines are without doubt known to you already. We build a very complete line of Single Cylinder, Tandem Compound and Cross Compound engines, medium and high speed, 20 to 1,200 h. p.

We offer these engines on their merits and not on a question of price.

THE BALL ENGINE CO., ERIE, PA.

Chicago Office: 1526 Monadnock Block: W. A. Kreider, Mgr.

"In the Bright Lexicon of Youth There Is No Such Word as Fail!"

WE USE THIS KIND OF A DICTIONARY, BUT THE MEMBERS OF THE TRUST COMPANIES EVIDENTLY USE ONE WHICH CONTAINS THE WORD, AND WE THINK ANY OF THEM COULD GIVE A CORRECT DEFINITION OF THE WORD FAIL IF THEY CARED TO.

They tried to coax us to join the Trust, but failed.

They offered to pay us to join the Trust, but failed.

They brought suits against us to compel us to join the Trust, but failed.

They have sought by every means which they could devise to force us into the Trust.

They have misrepresented their goods and ours, have circulated reports that we were going to join the Trust, that we were closed up, that our lamps were no good, that the people we employ were not competent, that we needed a guardian and they proposed to act in that capacity for us. This served only one purpose, and that was to add new customers to our already long list and to strengthen the purpose of our old customers not to buy Trust lamps so long as our lamps continue to give satisfaction.

They now seek to dispose of their old lamps, which have been used for several years to pad their inventory, by organizing fake companies and putting out these old fossils at "any old price" to take away our trade. This also will fail. If we have any second grade lamps, and they are very few, we sell them as such, price 14c; our best lamps are 17c.

CAN'T YOU USE SOME?

P. S.---The only reason they have not done some other mean thing is, they have not thought of it yet, but they probably will if they have time.

WE OFFER TO THE PUBLIC A NEW AND MARVELLOUS ELECTRIC CABLE,

Standardized in sizes for, and adapted to, all interior electric wiring adaptation. It is the only cable in the world combining Fire and Burglar alarm protection with all other interior electric wiring work, in same installation.

We confine ourselves to the manufacture and sale of this cable exclusively, it being auxiliary to all other electric interests.

By the use of this cable every infinitesimal part of every wire hereafter installed for whatever purpose in all buildings is made a detective point for the discovery and automatic notification of fire. We have opened up a new and rich field for the electrical contractor. If you are not acquainted with us and the cable, you should be Write or call and become so.

Write for illustrated and descriptive printed matter.

We own the sole and exclusive right to manufacture and sell the Montauk Multiphase Cable and Central Station Controller, by virtue of the following patents: No. 546,261, Sept. 10, 1895; No. 546,262, Sept 10, 1895; No. 565,053, Aug. 4, 1896; No. 565,178, Aug. 4, 1896; No. 565,188, Aug. 4, 1896; No. 565,217, Aug. 4, 1896; No. 565,410, Aug. 4, 1896; No. 591,034, Nov. 23, 1897; No. 591,247, Nov. 23, 1897; No. 594,281, Nov. 23, 1897, which broadly cover not only the method of manufacturing, but the basic principle upon which these cables are constructed.

Is now prepared to take orders for early delivery of all sizes of 3-Wire Constant Potential Registering Meters.

This meter is calibrated ready for instant use.
This meter requires no knowledge of electricity to oper.
This meter shows the load passing every instant.
This meter is hermetically sealed.
This meter measures correctly with uneven loads.
This meter can be calibrated with a watch in six minutes.
This meter requires no lubrication.
This meter is magnetically shielded.
This meter is direct reading, having no multiplier.
This meter does not reverse one thousandth of a horse power.
This meter will operate for years without opening.
The meter has no springs, jewels or frictional gear.

A WARNING

TO USERS AND PURCHASERS OF

KEYSTONE INSTRUMENTS.

We have recently learned that an unscrupulous contracting and manufacturing concern is supplying their trade with alleged modern "Keystone Instruments," which are in reality old instruments made by us years ago and purchased by them at second hand, they changing them in range and character to meet the requirements of their orders. These old Instruments are lacking in many of the improvements which make our modern line so desirable, and in addition have been botched in the change by lack of knowledge and facilities.

In view of this we desire to inform the public that every Instrument shipped from our factory is accompanied by a certificate duly signed, giving the serial number of the Instrument, its range and date of calibration.

We would warn the public to accept no Keystone Instruments unless accompanied by such a certificate.

Keystone Electrical Instrument Co.,

NINTH STREET AND MONTGOMERY AVE., PHILADELPHIA.

NEW YORK. BOSTON, CHICAGO.

Makes No Noise, Makes Money.

What the other man says.

It requires litte effort of imagination or self-conceit for a manufacturer to praise his own product, but the man who pays his good money for it looks at things from an entirely different point of view.

Mr. Owen, of the Onarga Electric Light and Water-works, Onarga, Ill., says: "*We take pleasure in stating that the machine has run constantly since starting it up (August, 1895), has never given us a moment's difficulty. Have never had to stop for any adjustment of bearings; never burned out a coil or had the slightest trouble in any way.*"

May we send our Catalogue of WARREN ALTERNATORS?

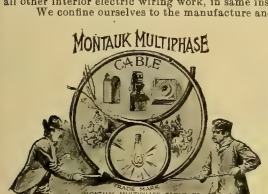
WARREN ELECTRIC MANUFACTURING CO.,

SANDUSKY, OHIO.

WE OFFER TO THE PUBLIC A NEW AND MARVELLOUS ELECTRIC CABLE,

Standardized in sizes for, and adapted to, all interior electric wiring adaptation. It is the only cable in the world combining Fire and Burglar alarm protection with all other interior electric wiring work, in same installation.

We confine ourselves to the manufacture and sale of this cable exclusively, it being auxiliary to all other electric interests.



By the use of this cable every infinitesimal part of every wire hereafter installed for whatever purpose in all buildings is made a detective point for the discovery and automatic notification of fire. We have opened up a new and rich field for the electrical contractor. If you are not acquainted with us and the cable, you should be. Write or call and become so.

Write for illustrated and descriptive printed matter.

We own the sole and exclusive right to manufacture and sell the Montauk Multiphase Cable and Central Station Controller, by virtue of the following patents: No. 546,261, Sept. 10, 1895; No. 546,262, Sept 10, 1895; No. 565,053, Aug. 4, 1896; No. 565,178, Aug. 4, 1896; No. 565,188, Aug. 4, 1896; No. 565,217, Aug. 4, 1896; No. 565,410, Aug. 4, 1896; No. 594,034, Nov. 23, 1897; No. 594,247, Nov. 23, 1897; No. 594,281, Nov. 23, 1897, which broadly cover not only the method of manufacturing, but the basic principle upon which these cables are constructed.

MONTAUK MULTIPHASE CABLE CO.

American Surety Building Rooms 9-10-11, 16th Floor. 100 Broadway, New York.

OFFICERS.

JOHN D. GOULD, Prest. C. W. PRICE, Vice-Prest.
CHAS. A. HANSON, Treas. and Sec'y.

Telephone, 4031 Cortlandt.

FACTORY: East 25th Street, New York.

RELIABILITY.

Do Not Throw Away
YOUR OLD LAMP BASES.

We buy them and pay spot cash. If you will send us samples of the different kinds of bases you have on hand, and the number of each, we will let you know by return mail how much we will pay for same.

J. F. VOICE & CO., 644 10th Street, Milwaukee, Wis.

A TECHNICAL EDUCATION 50 CENTS A WEEK.

The new installment plan of The International Correspondence Schools, Scranton, Pa.—the largest and most successful institution teaching technical subjects by mail—places an education within the reach of all. Students may enroll upon paying $2 in advance, the balance to be paid at the rate of $2 a month. The charges are moderate and include all necessary text-books. Studies are carried on at home without loss of time from work.

The Electrical Power and Lighting Scholarship is a thorough course of instruction in the installation, care and operation of electric light, power and railway plants designed to meet the wants of busy men who wish to put into actual practice as soon as possible the information they acquire.

The Mechanical-Electrical Scholarship includes instruction in mechanical and electrical engineering and is intended especially for those who wish to become designers of electrical machinery.

Also Courses including Steam Engineering, Mechanical Drawing, Machine Design, Civil Engineering, Bookkeeping, Shorthand and English branches.

Write for circular, stating subject in which you are interested.

THE INTERNATIONAL CORRESPONDENCE SCHOOLS, BOX 1002, SCRANTON, PA.

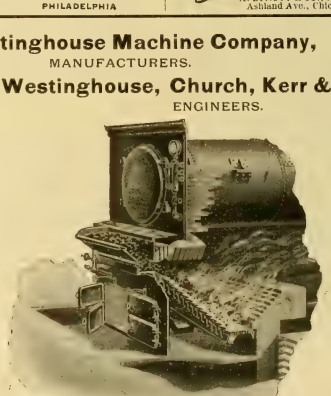
Westinghouse, Church, Kerr & Co.,
ENGINEERS.



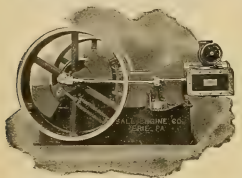
Managers of Electric Light and Power Stations are getting more and more alert to the smaller economies in the generation of power. They are alive to the fact that their finished product is power, and therefore they install expensive boilers, efficient engines and generators, and often pay considerable attention to their steam piping, but how many who are doing all this are practically nullifying it all by improper firing? Do they not know that every time the fire door is opened it cools off the fire, wastes coal and injures their boilers?

The Roney Mechanical Stoker obviates all this, enables one to use a cheaper grade of fuel and at the same time to derive the best results from the excellent machinery which receives its power from this service.

If you would know more of this standard piece of apparatus, address:

NEW YORK, 26 Cortlandt St. BOSTON, Westinghouse Bldg.
CHICAGO, 171 La Salle St. DETROIT, Union Trust Bldg.
PHILADELPHIA, M. R. Muckle, Jr. & Co., Drexel Bldg.

Features of Our Engines Worth Remembering:



1st—A symmetrical design with an intelligent, scientific distribution of metal, giving exceptional strength and perfect balance.
2nd—The only absolutely steam-tight valve, which automatically adjusts itself for wear, needing no outside attention.
3rd—"Rites governor system," which combines the greatest simplicity with most perfect regulation.
4th—Crank shaft forged open-hearth high-carbon steel, combining greatest strength, best wearing qualities and smoothest surface.
5th—Most complete automatic oiling system.

THE TELEPHONE HAND-BOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price $1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice, and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Magnet. Action.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magneto Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magneto Telephones.
11. The Shearer, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Naumayer and Böttcher Receivers.
13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cutting Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.

FROM THE

Electrician Pub. Co., 510 Marquette Bldg., Chicago.

In Going to St. Paul and Minneapolis

The wise traveler selects the Chicago, Milwaukee & St. Paul Railway.

Why?

It is the best road between Chicago and the Twin Cities.

It has the most perfect track.

Its equipment is the finest.

Its sleeping cars are palaces.

Its dining-car service is equal to the best hotels.

Its electric-lighted trains are steam-heated.

Its general excellence has no equal.

It is patronized by the best people.

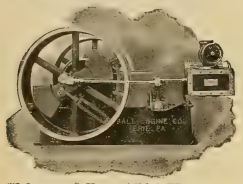
It is the favorite route for ladies and children as well as for men.

It is the most popular road west of Chicago.

It gives the choice of seven trains daily.

City Ticket Office, 95 Adams St., Chicago.

Features of Our Engines Worth Remembering:



1st—A symmetrical design with an intelligent, scientific distribution of metal, giving exceptional strength and perfect balance.
2nd—The only absolutely steam-tight valve, which automatically adjusts itself for wear, needing no outside attention.
3rd—"Rites governor system," which combines the greatest simplicity with most perfect regulation.
4th—Crank shaft forged open-hearth high-carbon steel, combining greatest strength, best wearing qualities and smoothest surface.
5th—Most complete automatic oiling system.

TEST! THE WILLARD STORAGE BATTERY.

We respectfully announce that we succeeded to the business of the Willard Electric & Battery Company some two months ago, that we have admitted to our partnership Mr. T. A. Willard and H. M. Hawley, and that the business will hereafter be conducted under the firm name of SIPE & SIGLER.

During the past two months we have been busily engaged in fitting up our power building with the finest special machinery for the **rapid and perfect manufacture of Willard Storage Batteries,** and we are now prepared to deliver with reasonable promptness Willard Batteries of any size and for any purpose.

While we have equipped our building—which, by the way, is one of the most perfectly appointed power buildings to be found—for the manufacture of the largest storage batteries, yet we are as well prepared to supply smaller ones.

We make plates in all sizes from 5 in. x 7 in. to 18 in. x 32 in. We also make the concentric type in the smaller size down to five ampere hours capacity.

We respectfully request anyone interested in storage batteries for whatever purpose, and especially for large power or lighting plants, to investigate the mechanical and electrical construction of the Willard Battery.

We invite inquiry and court scientific tests, and we will take pleasure in supplying anyone with the means by which he may inform himself as to the merits of the Willard Battery.

We believe that an investigation of the Willard Batteries, that have been in use from two to five years, and a scientific test of the Willard plate, cannot fail but convince the most skeptical of the wonderfully superior qualities of this battery.

As an encouragement for interested parties to make scientific tests and comparisons, we will supply a single cell of any size for this purpose **AT ONE-HALF OUR NET PRICE** to any reputable dealer or electrical engineer upon receipt of the order below, signed by such dealer, engineer or other person interested in storage batteries.

We call attention to four most important features that you may expect in testing the Willard Battery:

1st. That each cell will equal or exceed its rated capacity.

2nd. The high efficiency at high rate of discharge.

3rd. That high rate of discharge will have no ill effect upon the battery.

4th. That the cell may remain discharged for a long period without ill effects, which treatment would be fatal to the average storage battery.

Beyond these exceedingly important features there are many advantages that a test will develop, and which we leave to your determination.

MESSRS. SIPE & SIGLER:

You may send one cell of.....ampere hours capacity and bill the same at one-half your net price. We agree to make a scientific test of this cell.

DIEHL MANUFACTURING CO.,
ELIZABETHPORT, N. J.

The Swinging Tree Insulator

Manufactured by

WESTERN ELECTRIC COMPANY.

This Tree Insulator will thoroughly protect your lines from swaying branches without cutting the insulation.

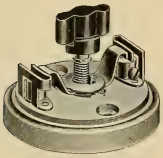
It is readily hung from a hook or wire twisted through the loop at the top, and by lengthening the wire can be adapted to a wide range of conditions.

It can be used with advantage for supporting arc light wires under iron roofs.

WESTERN ELECTRIC COMPANY,

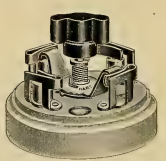
CHICAGO. NEW YORK.

Hart Switches for 500 Volt Circuits.



No. 20½. 5 Ampere, S. P.

No. 21½. 10 Ampere, S. P.



No. 23½. 5 Ampere, 3-Way.

These switches are guaranteed to work on 500 volt circuits without causing trouble or "playing out."

No. 21½ is especially designed for electric heaters.

Continued orders from customers who have used these switches for years is convincing proof that they perform their work in a satisfactory manner.

For particulars, see our illustrated catalogue.

All switches of our manufacture are stamped "Hart Switch" on the metal.

THE HART & HEGEMAN MFG. CO., Hartford, Conn.

THE S. K. C. SYSTEM.

A COMPLETE SYSTEM FOR

Long Distance Transmission, General Station Distribution, Mill and Factory Equipment.

Generators will be wound and guaranteed for an E. M. F. as high as

10,000 VOLTS.

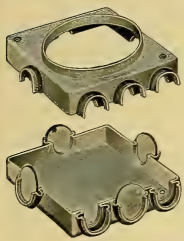
GOOD CARBONS MEAN LESS COST FOR CURRENT. Therefore, wherever a highly efficient service is desired, it is of the utmost importance to use the best Carbons obtainable.

"All the excellence in dynamos and arc lamps counts for but little, when poor Carbons are used in the lamps."

NOTICE.—The "Electra" Highest Grade Nuernberg Carbons are, as heretofore, manufactured by the world-renowned firm of C. Conradty of Nuernberg. See that every package of my Carbons bears the label with my trade-mark "Electra," and thus beware of imitations. To protect the interest of purchasers of my Carbons, I am determined to proceed against infringers of my "Electra" trade-mark.

STEEL BOXES.



STEEL SPLIT BOXES FOR 5-8 CONDUIT.

NOTE the good points of this box!
NOTE that it is non-breakable!
NOTE the length of the projecting lugs!
NOTE that the inner rim of outlet is smaller than the outer!
NOTE from this that the conduit cannot run too far into box!
NOTE the removable discs!
NOTE that it weighs but 21 ounces!

If you have noted well all these good points you will have discovered the Best Split Conduit Box on the Market. Our new Catalogue "D" will tell you about our other 1,200 styles of Steel Outlet Boxes. We also manufacture Steel Boxes for Panel Boards.

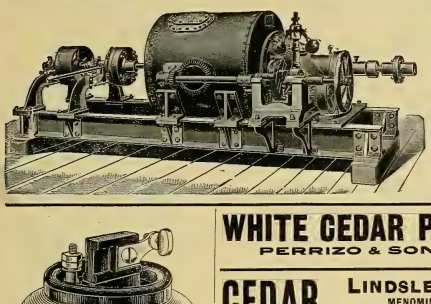
Victor Turbine Water Wheel.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

THE MOTOR ENGINEERS' AND ELECTRICAL WORKERS' HAND-BOOK.

By WM. LINTERN.

INTRODUCTION.

The Motor Engineers' and Electrical Workers' Hand-Book is compiled with a view of furnishing a book of reference in a simple and convenient form for the use of motor engineers and street railway men. The diagrams of controller connections and combinations will be found of great value in practical work. The methods of testing are both simple and reliable. The writer is indebted to the Westinghouse, General Electric, Walker and Steel Motor companies for information cheerfully furnished.

TABLE OF CONTENTS

Chapter I. Elementary Principles. Units, Ohm's Law, Watt, Kilowatt, Ampere, Turn, Hour, etc. Potential, E. M. F., Voltage, Drop of Potential, Resistance (Ohmic), Conductivity. **Chapter II.** Magnetism and Electro-Magnetic Induction. **Chapter III.** Circuits. Varieties of Circuits, Series, Shunt Parallel or Multiple Arc, Joint Resistances of Parallel Circuits, Multiple Series, Series Multiple. **Chapter IV.** Dynamo Electric Machine. General Principles, Field Windings, (Varieties) Series, Shunt, Compound, etc. Short Shunt, Long Shunt. **Chapter V.** Instructions for Operating Generators. Running a Single Generator, To Shut Down a Machine Not Run in Multiple, Sparking, Polarity, Excitation Grounds, Generators in Multiple, Connections, Running Generators in Multiple. To Shut Down a Machine Running in Multiple. **Chapter VI.** The Electric Motor, General Principles, Counter Electromotive Force and Mechanical Power, Efficiency. **Chapter VII.** Measurements and Tests of Street Railway Motors, Faults, Measurement by Drop of Potential Method (Examples), Insulation Tests, Voltmeter Method, Description of Voltmeter and Ammeter. The Wheatstone Bridge, Instructions for Operating Drop of Potential in Motor Circuits. **Chapter VIII.**—Instructions for Operating Car Apparatus: Brushes, Sparking at Brushes, Bearings, Backing, Tires, Block Operating Car, Trolley, etc. **Chapter IX.**—The Electric Motor Car in Detail. Series Parallel Controller, Reverse Switch, Rheostat, Fuse Box, Lightning Arrester, Heaters. **Chapter X.** Definitions of Terms. **Chapter XI.**—Diagrams of Car Wiring and Controllers, with Written Descriptions and Diagrams of Combinations: Westinghouse System 16, No. 11 No. 28 and 28 A); General Electric (K, with W. P. Machines, K 2, General Electric System, Parallel Controller with Magnetic Brake). Walker System (12 E). Steel Motor Co. System. **Chapter XII.** General Electrical and Mechanical Information. Belting, Shafting, Pulleys and Gears, Melting Point, Specific Gravity and Relative Conductivity. Table Comparing Wire Gauges, Number, Diameters, Height, Length and Resistance of Pure Copper Wire, Electrical Units and Formulas, Equivalent Carrying Capacity, Proportions of Gear Teeth, Notes, Bill of Material for Span Wire Construction (Single Track) (Double Track), Bracket Construction, (Single Track) (Center Pole) (Double Track).

150 pages. Handsomely bound in cloth, $1.00. Heavy boards, 50c. Sent on receipt of price.

THE TELEPHONE HAND-BOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price $1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magneto Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magneto Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. Hipp, Shuttuck, Koltra, Neumayer and Ritchie Receivers.
13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bell.
26. Automatic Switches.
27. Telephone Line Construction
28. Metallic Circuit.
29. Underground Wires
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser; Its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony
Appendix.

THE WARNER SLOW SPEED

Telephone Generator.

A direct-connected motor-dynamo to furnish current for operating telephone subscribers' bells. Capacity 1,200 phones, and guaranteed to ring six phones continuously. Furnished wound to be run on 110, 220 or 500 volt direct current circuits. Occupies space less than twelve inches square. Send for circular giving full particulars.

W. F. WARNER, - - Muncie Indiana.

The Lockwood Transmitter

Is protected by letters patent No. 528640 and No. 557588, issued Nov. 6, 1894, and April 7, 1896, respectively.

The electrodes have "A variable air space" between them, and the adjustment is obtained by tension instead of pressure. The Lockwood is positively the only Transmitter on the market having no contact BETWEEN electrodes, consequently parties liable to infringement suits and promoters of long-distance systems will find it to be the only telephone that will satisfy the fears of their subscribers. The Transmitter can be placed upon any instrument now in use, and an exchange of Transmitters is easily effected.

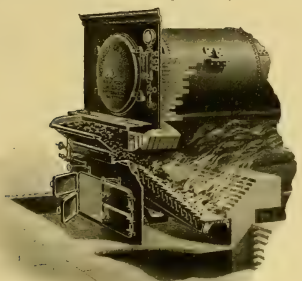
Westinghouse, Church, Kerr & Co.,

ENGINEERS.



Managers of Electric Light and Power Stations are getting more and more alert to the smaller economies in the generation of power. They are alive to the fact that their finished product is power, and therefore they install expensive boilers, efficient engines and generators, and often pay considerable attention to their steam piping; but how many who are doing all this are practically nullifying it all by improper firing? Do they not know that every time the fire door is opened it cools off the fire, wastes coal and injures their boilers?

The Roney Mechanical Stoker obviates all this, enables one to use a cheap r grade of fuel and at the same time to derive the best results from the excellent machinery which receives its power from this service

If you would know more of this standard piece of apparatus, address

JAMES LEFFEL & CO., Springfield, Ohio, U. S. A.

THE McCORMICK TURBINE.
On Vertical or Horizontal Shaft, Especially Adapted for Electrical Work.
Gives more power per diameter with a higher percentage of useful effect than any other water-wheel heretofore made. All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.
Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with us, as we are willing to guarantee results where others have failed, no matter what make of turbine has been in use.
STATE REQUIREMENTS AND SEND FOR CATALOGUE.
S. MORGAN SMITH CO., York, Pa.
Estimates furnished for complete power plants and results guaranteed.

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 96mo, 150 pp. Price $1.00.
This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound, fully illustrated. Price $1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D. 12mo, cloth, 422 pp., 182 illustrations. Price $1.00.
This book describes the construction of the various forms of transmitting and receiving devices, the signalling mechanisms, and the selected apparatus at the central station. It is written by two well known electricians, and is, it is said, the latest work on the subject.

THE AUTOMATIC TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 12mo, 200 illustrations. Price $1.50.
In this edition the author has endeavored to produce a manual of service, type and cost, but thoroughly practical, and, as far as space will allow, the most recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManman, edited by Prof. C. H. Haskins. Sixth edition. 16mo, 50 pp. Price 25 cents.
This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price $1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 508 pages. 333 illustrations. Price $4.00.

HOW TO MAKE AND USE THE TELEPHONE By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price $1.00.

TELEPHONES, THEIR CONSTRUCTION AND FITTING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp., 168 illustrations. Price $2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 169 illustrations. Price $4.00.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 90 pages. 23 illustrations. Price $1.00.

TELEPHONE LINES: Telephone Wires versus Electric Light Wires; Electric Bell Construction, Part I.; Electric Bell Construction, Part II.; Bonsetop Lines, Pole Lines and Aerial Cables; Anticipations of Great Discoveries and Inventions. New edition, Revised, 192 pages. Price $1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 795 pages. 356 illustrations. Price $4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages. 3 plates and 48 engravings. Price $2.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PAPERS OF ELECTRICITY, treating on the telegraph, telephone, etc. By E. J. Houston. 359 pages. 88 illustrations. Price $1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

AMERICAN BATTERY CO.,

ESTD 1888. 174 S. Clinton St., Chicago, Ill.

WE OFFER TO THE PUBLIC A NEW AND MARVELLOUS ELECTRIC CABLE,

Standardized in sizes for, and adapted to, all interior electric wiring adaptation. It is the only cable in the world combining Fire and Burglar alarm protection with all other interior electric wiring work, in same installation.

We confine ourselves to the manufacture and sale of this cable exclusively, it being auxiliary to all other electric interests.

By the use of this cable every infinitesimal part of every wire hereafter installed for whatever purpose in all buildings is made a detective point for the discovery and automatic notification of fire. We have opened up a new and rich field for the electrical contractor. If you are not acquainted with us and the cable, you should be. Write or call and become so.

Write for illustrated and descriptive printed matter.

We own the sole and exclusive right to manufacture and sell the Montauk Multiphase Cable and Central Station Controller, by virtue of the following patents: No. 516,261, Sept. 10, 1895; No. 516,262, Sept. 10, 1895; No. 565,053, Aug. 4, 1896; No. 565,178, Aug. 4, 1896; No. 565,188, Aug. 4, 1896; No. 565,217, Aug. 4, 1896; No. 565,410, Aug. 4, 1896; No. 594,034, Nov. 23, 1897; No. 594,247, Nov. 24, 1897; No. 594,281, Nov. 23, 1897, which broadly cover not only the method of manufacturing, but the basic principle upon which these cables are constructed.

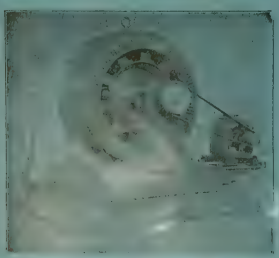
Makes No Noise, Makes Money.



Facts.

The unctuous arguments and beguilements of a clever salesman are often used to cover a multitude of inherent defects in the machine he wants to sell. He adroitly avoids the vital points and seeks to convince with a meaningless philter of words.

The Warren Alternator

Needs no garrulous knight to champion its virtues. Simple statements of facts—and nothing but facts, devoid of technical verbiage, are all that is necessary in selling Warren Alternators.

May we mail you a few of the facts?

WARREN ELECTRIC MANUFACTURING CO.,

SANDUSKY, OHIO.

IS IT GOOD MANAGEMENT to install high grade machinery in your station and low grade lamps on your lines, the lamp being the END, AIM and TEST of the lighting system? If this is suggestive and you now want to adopt a strictly high grade lamp, try the

New Lynns, 20c.
Renewed, 15c.
Lamps Renewed, 12c.

Equally good in life, uniformity of current consumption and maintenance of candle power.

Our **NEW LYNN LAMP** is perfection in style and general construction. **Write for circulars.**

LYNN INCANDESCENT LAMP CO., LYNN, MASS.

PIONEER IN LAMP RENEWING.

NEW YORK, 203 Broadway. BALTIMORE, 322 No. Front St. CINCINNATI, 414 Pike Bldg. CHICAGO, 939 Monadnock Blk.

INCANDESCENT LAMP SUPPORTERS.

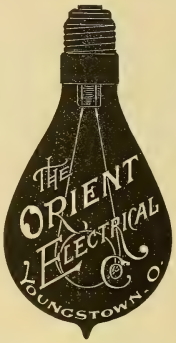
Instant placement and fixture of lamp in any desired position, with no attention to fastenings. Adapted to every requirement from library to workshop. Send for catalogue C.

THE O. C. WHITE CO.,
WORCESTER, MASS.

THE ORIENT

Is an Honest Lamp.

Not in the Trust.



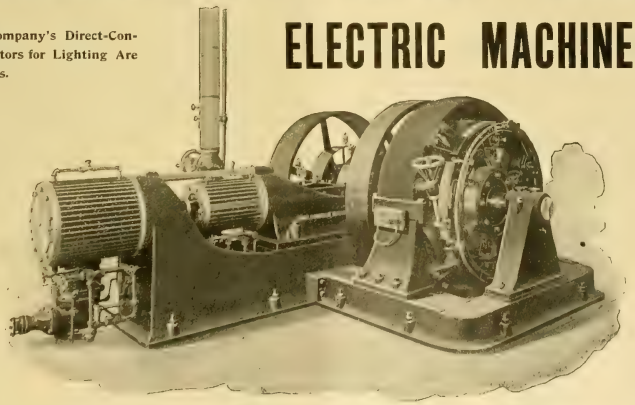
We do not make all kinds of **wild claims,** but can point to a larger proportion of **satisfied customers** than any other factory. If you are not using Orient Lamps write us. We can do you good.

Prices Always Below the Trust.

WALKER COMPANY,

ELECTRIC MACHINERY.

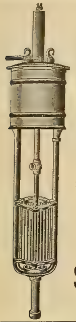
Walker Company's Direct-Connected Generators for Lighting Are Justly Famous.



You Cannot Get Better Than the Best, Which Is Walker Apparatus.

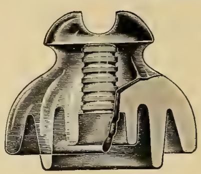
CLEVELAND, OHIO.
General Sales Office, No. 1 Nassau St., NEW YORK CITY.

NEW HAVEN, CONN.
AGENCIES IN ALL PRINCIPAL CITIES.



THE S-W
Arc Light Radiators
BRILLIANT AND ECONOMICAL.
Absolutely free from **side shadows**, or those cast by flying insects.
Diffuses light uniformly.
Easily attached and detached.
Can be cleaned without removal and are practically indestructible.
Made for all styles of arc lamps.
Send for descriptive circular and prices.
General Agency: Chicago General Fixture Co., 169 Adams Street, Chicago, Ill.
Shadowless Radiator Mfg. Co.,
FARIBAULT, MINN.

High Potential Insulators
IN GLASS AND PORCELAIN.



Will carry any current up to 50,000 volts. Used on the Niagara Falls and Buffalo Transmission lines.
Insulators for High Voltage Power Transmission, Electric Railway, Electric Light, Telegraph and Telephone Lines.
Send for Catalogue.

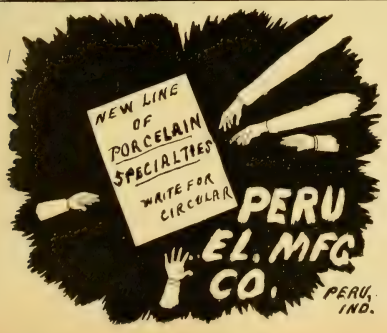
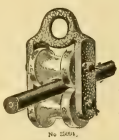
Every Lighting man should have one.

ELECTRICIAN PUBLISHING CO.,
Suite 510 Marquette Bldg., CHICAGO.



The Swinging Tree Insulator

Manufactured by
WESTERN ELECTRIC COMPANY.



This Tree Insulator will thoroughly protect your lines from swaying branches without cutting the insulation.

It is readily hung from a hook or wire twisted through the loop at the top, and by lengthening the wire can be adapted to a wide range of conditions.

It can be used with advantage for supporting arc light wires under iron roofs.

WESTERN ELECTRIC COMPANY,
CHICAGO. NEW YORK.

The name of
WESTINGHOUSE
is a guarantee.

Everybody Knows

That we make big machines and that others make little ones; but everybody does not know that we make little machines also.

The PHILADELPHIA PRESS of Sept. 19, 1897, gives "Holland's" interview with Lord Kelvin.

It says:

"Lord Kelvin seems to have been particularly impressed with all that he saw in the great yards of the Westinghouse Co.

"Lord Kelvin spoke of the Induction Motors there built, and added that he would be glad if he were able to say in print how greatly he had been impressed with the scientific work of Shallenberger and Scott in electrical measuring instruments, and other developments, as he had seen the work done there."

"Of course," continues "Holland," "that is extraordinary praise."

Tesla Polyphase, Type "C", Induction Motors,—the kind that have no moving contacts—can be started at any distance.

Wurts Lightning Arresters,—the Wurts with the U.

Transformers,—the self-cooling kind.

Meters,—the kind adopted as the standard by the British Board of Trade.

Direct Current Machines,—all kinds and sizes.

GOOD BOOKS.

AUTHORITIES ON SUBJECTS MENTIONED.

The Pocket Electrical Dictionary. Containing all of the words and definitions in the science. A new work. Indispensable to the electrician, student and professor. Over 11,000 words and about 15,000 definitions. By *Edwin J. Houston*, A. M., Ph. D. (Princeton). 1 volume, 32mo, cloth, **$2.50**; leather, **$3.00.**

Electricity Made Easy. Profusely illustrated. A hand-book for busy people. By *Edwin J. Houston*, A. M., Ph. D., and *Arthur E. Kennelly*, Sc. D. 1 volume, 12mo, cloth, **$1.50.**

Dynamo-Electric Machinery. By *Silvanus P. Thompson*, D. Sc., B. A., F. R. S. Sixth edition, revised and enlarged. Profusely illustrated with new engravings. 16 folding plates. 2 volumes, 8vo, cloth, gilt, **$6.00.**
The rapid advance of electrical science made it absolutely necessary to revise the last edition, and this is now a new work. It is indispensable to the electrical expert, professor and student of electrotechnics. Students and professors highly appreciate the publication of this extensive work in two volumes.

Polyphase Electric Currents and Alternate Current Motors. By *Silvanus P. Thompson*, D. Sc., B. A., F. R. S. 1 volume, 8vo, cloth, gilt, **$3.50.**
The most important work on the subject. A companion book to "Dynamo-Electric Machinery." One of the text-books in schools of technology and colleges. Beautifully illustrated with fine engravings. Folding plates. Invaluable to the expert electrician.

Algebra Made Easy. By *Edwin J. Houston*, Ph. D., and *A. E. Kennelly*, Sc. D.
This little work is of special value to readers of Prof. Thompson's Dynamo-Electric Machinery and Polyphase Electric Currents, as the work has been written to explain in a clear and simple manner the equations contained in those works. 1 volume, 16mo, cloth, **75** cents.

The Interpretation of Mathematical Formulae. By *Edwin J. Houston*, Ph. D., and *A. E. Kennelly*, Sc. D. 1 volume, 12mo., cloth, **$1 25.**
A most valuable aid to students and electrical workers.

A B C of Electricity. Now approaching its 65th thousand. By *William H. Meadowcroft*. 1 volume, 12mo, cloth, **50** cents. Fully illustrated.
This excellent primary book has taken the first place in elementary scientific works. It has received the endorsement of Thomas A. Edison. It is for every person desiring a knowledge of electricity, and is written in simple style so that a child can understand the work. It is what its title indicates, the first flight of steps in electricity.

Scholars' A B C of Electricity. By *William H. Meadowcroft*. 1 volume, 12mo, illustrated, cloth, **50** cents.
The author of this work has designed it for the use of teachers and scholars. A large number of simple experiments have been added, with notes relative to the work. It is the primary book for school use.

The X Ray; or Photography of the Invisible and its Value in Surgery. By *William J. Morton*, M. D. Written in collaboration with *Edwin W. Hammer*, 1 volume, 12mo, cloth and silver, **75** cents; paper, **50** cents.
The work explains in clear and simple style how these extraordinary pictures are taken through solids. Full description is given of the apparatus used, and the text is profusely illustrated with half-tone illustrations giving facsimile copies of the pictures taken from the negatives of the author. The subjects are varied.

The A B C of the X Ray. By *William H. Meadowcroft*. 1 volume, 12mo, cloth and gold, **75** cents.
The first primary work on the subject. A book for the people. The author of "A B C of Electricity" showed clearly in that work his ability to explain a technical subject for the laymen who know nothing of scientific terms. He has written this work about the X Ray in his usual clear and simple style, and a wide circulation of this useful book is assured. The text of the author is beautifully embellished with fine engravings, and nothing is omitted that will give the public a clear knowledge of this remarkable discovery of Prof. Rontgen. The public would do well to secure both these important works.

THE "CLARK" WIRE.

FOR SWITCHBOARD, RAILWAY and MOTOR USE.

All sizes of Stranded and Flexible Wire and Cables with Clark's Insulation

Inspector Boston Fire Underwriters' Union says:
"A thoroughly reliable and desirable wire in every respect."

The Clark wire has been before the public and in use for the past ten years, and has met with universal favor. We guarantee our insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class insulated wire. We shall be pleased to mail Catalogues, with terms and discounts for quantities.

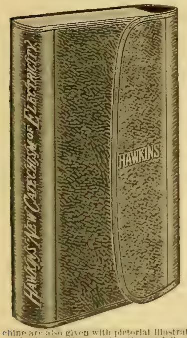
HAWKINS' NEW CATECHISM OF ELECTRICITY.

Plan of the Work, Contents, Etc.



The New Catechism of Electricity will be found to be surprisingly plain, and free from useless and ambiguous terms. The plan upon which it is arranged is unique.

The book is, first of all, intended to be plain and instructive; some 300 illustrations have been introduced, so that the mere pictures will afford almost a knowledge of the subjects.

It is a school book from the manner in which it proceeds from the simple facts to the abstract principles which the facts indicate; it is also a book of reference through the index of seventeen double columns of fine type pages, by means of this index a thousand items of practical importance are at once available.

It is an up-to date work, which has cost a large outlay of capital and time, and, in short, it is doubtful if any more attractive book has ever been issued or one more useful.

The subjects treated upon are as follows: Dedication to Thomas A. Edison, with engraving of Mr. Edison; Preface and Introduction; Nature and Source of Electricity and Magnetism.

The Dynamo; Conductors and Non-Conductors; Symbols, abbreviations and definitions relating to electricity, Parts of the Dynamo, The Motor; The Care and Management of the Dynamo and Motor.

Electric Lighting, Wiring; The rules and requirements of the National Board of Underwriters in full; Electrical Measurements.

The Electric Railway; Line Work; Instruction and Cautions for Linemen and the Dynamo Room, Storage Batteries, Care and Management of the Street Car Motor; Electro Plating.

The Telephone and Telegraph; The Electric Elevator, Accidents and Emergencies, etc., etc.

The full one-third part of the whole work has been devoted to the explanation and illustrations of the dynamo, and particular directions relating to its care and management, all the directions are given in the simplest and most kindly way to assist rather than confuse the learner. The names of the various parts of the machine are also given with pictorial illustrations of the same.

In the Catechism no less than 25 full page illustrations have been given of the various dynamo machines made in different parts of the country, and an equal number of part page illustrations.

ELECTRICIAN PUBLISHING CO., 510 Marquette Bldg., CHICAGO.

STREET RAILWAY MEN

—And others engaged in electric railway work will be interested in

THE MOTOR ENGINEERS' AND ELECTRICAL WORKERS' HAND-BOOK.

By WM. LINTERN.

The Motor Engineers' and Electrical Workers' Hand-Book is compiled with a view of furnishing a book of reference in a simple and convenient form for the use of motor engineers and street railway men. The diagrams of controller connections and combinations will be found of great value in practical work. The methods of testing are both simple and reliable. The writer is indebted to the Westinghouse, General Electric, Walker and Steel Motor companies for information cheerfully furnished.

TABLE OF CONTENTS

Chapter I. Elementary Principles. Units, Ohm's Law, Watt, Kilowatt, Ampere Turn Hour, etc. Potential, E. M. F., Voltage, Drop of Potential, Resistance (Ohmic) Conductivity. **Chapter II.** Magnetism and Electro-Magnetic Induction. **Chapter III.** Circuits: Varieties of Circuits, Series Shunt Parallel or Multiple Arc, Joint Resistances of Parallel Circuits, Multiple Series, Series Multiple. **Chapter IV.** Dynamo Electric Machine. General Principles, Field Windings, (Varieties) Series Shunt, Compound etc. Short Shunt Long Shunt. **Chapter V.** Instructions for Operating Generators. Running a Single Generator. To Shut Down a Machine Not Run in Multiple. Sparking, Polarity, Excitation Grounds. Generators in Multiple, Connections Running Generators in Multiple. To Shut Down a Machine Running in Multiple. **Chapter VI.** The Electric Motor. General Principles, Counter Electromotive Force and Mechanical Power, Efficiency. **Chapter VII.** Measurements and Tests of Street Railway Motors. Faults, Measurement by Drop of Potential Method (Examples), Insulation Tests, Voltmeter Method, Description of Voltmeter and Ammeter. The Wheatstone Bridge. Instructions for Operating. Drop of Potential in Motor Circuits. **Chapter VIII.** Instructions for Operating Car Apparatus. Brushes, Sparking at Brushes, Bearings, Bucking, Fuse Block, Operating Car, Trolley, etc. **Chapter IX.** The Electric Motor Car in Detail. Series Parallel, Controller, Reverse Switch, Rheostat, Fuse Box, Lightning Arrester, Heaters. **Chapter X.** Definitions of Terms. **Chapter XI.** Diagrams of Car Wiring and Controllers with Written Descriptions and Diagrams of Combinations. Westinghouse System (G. No. 11, No. 28 and 28 A). General Electric (K, with W. P. Machines, K 2, General Electric Series Parallel Controller with Magnetic Brake). Walker System (B 2, L). Steel Motor Co. System. **Chapter XII.** General Electrical and Mechanical Information. Belting, Shafting, Pulleys and Gears, Melting Point, Specific Gravity and Relative Conductivity. Table Comparing Wire Gauges, Number, Dimensions, Height, Length and Resistance of Pure Copper Wire. Electrical Units and Formulas, Equivalent Carrying Capacity. Proportions of Gear Teeth. Notes. Bill of Material for Span Wire Construction (Single Track) (Double Track), Bracket Construction (Single Track) (Center Pole) (Double Track).

160 pages. Handsomely bound in cloth $1.00. Heavy board, 50c. Sent on receipt of price.

THE TELEPHONE HAND-BOOK

BY HERBERT LAWS WEBB.

Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."

146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price $1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and the TELEPHONE HAND-BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that anyone can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telegraphy. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: Its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magneto Telephones.
9. The Bell Telephone Receiver.
10. Other forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Reiniger Receivers.

In Going to St. Paul and Minneapolis

The wise traveler selects the Chicago, Milwaukee & St. Paul Railway.

Why?

It is the best road between Chicago and the Twin Cities.

It has the most perfect track.

Its equipment is the finest.

Its sleeping cars are palaces.

Its dining-car service is equal to the best hotels.

Its electric-lighted trains are steam heated.

Its general excellence has no equal.

It is patronized by the best people.

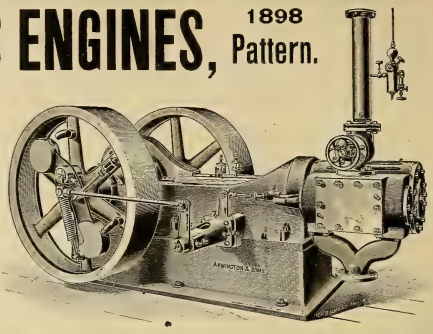
It is the favorite route for ladies and children as well as for men.

It is the most popular road west of Chicago.

It gives the choice of seven trains daily.

City Ticket Office, 95 Adams St., Chicago.

ARMINGTON & SIMS ENGINES, 1898 Pattern.



Unexcelled in Design, Workmanship, Efficiency, Regulation.
Double ported, Self-Adjusting Cylindrical Valves.
Absolutely Tight. Perfect Steam Distribution.
Rites Inertia Governor. Simple. Powerful. Effective.
Engines 25 to 2,000 H. P. Capacity, to meet the requirements of any service.

WE INVITE CORRESPONDENCE WITH ALL INTERESTED IN THE ECONOMICAL DEVELOPMENT OF POWER.

ELECTRIC LIGHTING BY "OTTO" GAS ENGINES

Is much CHEAPER than what you are paying for current. Hundreds of plants are using from two to three hundred horse power.

THE OTTO GAS ENGINE WORKS, PHILADELPHIA.

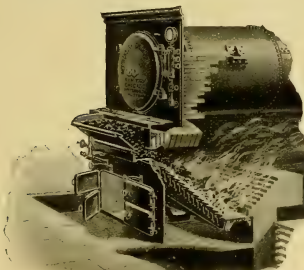
NEW YORK, 39 Cortlandt St. BOSTON, 19 Pearl St. CHICAGO, 215 Lake St. OMAHA, 321 South 15th St.

FOOS Gas and Gasoline Engines EXCEL ALL OTHERS IN DESIRABLE FEATURES.

Adapted for ALL Power Purposes—Electric Lighting, Milling, Mining, Water Works, Elevators, Factories, etc. Cheaper and Better than Steam. 2 to 250 H. P. Write Before Purchasing. FOOS GAS ENGINE CO., Springfield, O.

Westinghouse Machine Company, MANUFACTURERS.

Westinghouse, Church, Kerr & Co., ENGINEERS.

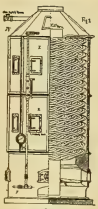


Managers of Electric Light and Power Stations are getting more and more alert to the smaller economies in the generation of power. They are alive to the fact that their finished product is power, and therefore they install expensive boilers, efficient engines and generators, and often pay considerable attention to their steam piping; but how many who are doing all this are practically nullifying it all by improper firing? Do they not know that every time the fire door is opened it cools off the fire, wastes coal and injures their boilers?

The Roney Mechanical Stoker obviates all this, enables one to use a cheaper grade of fuel and at the same time to derive the best results from the excellent machinery which receives its power from this service.

If you would know more of this standard piece of apparatus, address:

NEW YORK, 26 Cortlandt St. BOSTON, Westinghouse Bldg.
CHICAGO, 171 La Salle St. DETROIT, Union Trust Bldg.
PHILADELPHIA, M. E. Muckle, Jr. & Co., Drexel Bldg.



THE Clonbrock Steam Boiler Co., BROOKLYN, N. Y.

Manufacturers of the

Morrin "Climax" and "Compound" Safety Water Tube Boilers.

BUILT IN UNITS OF 50 TO 1,000 H. P.

CAUTION: Beware of infringers, they will be rigidly prosecuted.

ALSO BUILDERS OF

Smoke Stacks, Tanks, Etc., and All Classes of Iron Work.

Specifications, Drawings and Prices furnished on application.

Send for Catalogue of Climax and Compound Boilers.

SCALE FORMATION AN IMPOSSIBILITY

When EXPURGATOR Is Used.

A trial order will convince you that it is the most **economical** and **modern** method of boiler cleaning. **Removes old scale and keeps the boiler clean.** Saves **time,** money and repairs. Endorsed and for sale by

ELECTRICITY AND MAGNETISM.

A series of thirty-four lessons covering the Science of Electricity from its Fundamental Principles to its Everyday Practical Application. Comprises 325 pages, over 300 diagrams and illustrations. Price $2. By

PROF. D. C. JACKSON, University of Wisconsin.
PROF. H. S. CARHART, University of Michigan.
PROF. E. F. THOMAS, University of Ohio.
PROF. WM. A. ANTHONY, of New York.
PROF. BROWN AYRES, Tulane University.
PROF. A. C. PERRINE, Leland Stanford University, Cal.
PROF. GEO. D. SHEPARDSON, University of Minn.

A Comprehensive Treatise in Simple Language, free from Algebraic Equations and Easily Understood. And others.

TABLE OF CONTENTS:

1. The nature and properties of electricity.
2. Machines for generating electricity by friction and by electric induction.
3. Electric batteries or appliances for generating electricity by chemical action.
4. Electric batteries or appliances for generating electricity by chemical action (concluded).
5. The magnetic effects of electric currents, magnetic fields.
6. The magnetic effects of electric currents, and magnetic circuits.
7. Ohm's law of the flow of electricity.
8. Heating effects of electric currents. Miscellaneous effects of electric currents.
9. Galvanometers and voltameters.
10. Measurement of electrical resistance.
11. Everyday measurements of electric currents and pressures.
12. Everyday measurements of electric power. Condensers and the measurement of their capacity.
13. Electrolytic deposition of metals.
14. The electric telegraph.
15. Multiple telegraphy.
16. The telephone.
17. The construction of telegraph and telephone lines and instruments.
18. Testing lines for insulation and conductivity and the location of leaks and breaks.
19. Principles of continuous current dynamos and motors.
20. Principles of continuous current dynamos and motors, their construction, care and attendance.
21. Arc lighting and arc light machinery.
22. Incandescent lighting and power transmission, two, three and five wire systems of distribution for electric lights and motors.
23. Construction of electric light and power circuits and their testing.
24. Testing electric light circuits, and the distribution and measurement of light.
25. Electromagnetic induction.
26. Alternating currents.
27. Alternating currents and alternating current machinery (concluded).
28. Miscellaneous applications of electric motors.
29. Electric railways.
30. Methods of handling and controlling railway motors and generators.
31. Model electric plants.
32. Underwriters' rules, etc.
33. Electric welding, forging, etc.; electricity applied to the kitchen.
34. Electrotherapeutics.

THE PELTON WATER WHEEL

Is known the world over as affording the most simple, reliable and economical power for all purposes.

7,000 WHEELS NOW RUNNING

ELECTRIC POWER TRANSMISSION.

Filling every condition of service in a most efficient and satisfactory way.

Pelton Wheels are especially adapted to this purpose and are operating the majority of stations of this character in all parts of the world. Highest efficiency and best regulation guaranteed. Catalogues furnished on application. Address

PELTON WATER WHEEL CO.,

143 Liberty Street, NEW YORK, N. Y., U. S. A. or 121-123 Main Street. SAN FRANCISCO, CAL., U. S. A.

GRAPHITE FOR RESISTANCE...

Made in almost any form required and of 1 ohm or 1,000,000 ohms as desired. We also make graphite boxes and crucibles resisting heats of 4,000 degrees. . . . . .

JOS. DIXON CRUCIBLE CO., - - Jersey City, N. J.

WATER WHEELS

For Heads of 3 Feet to 2000 Feet.

Especially adapted to all kinds of

ELECTRIC POWER AND LIGHTING PLANTS.

Recent tests at Holyoke, given below, enable us to guarantee: *The Largest Power ever obtained from a wheel of the same diameter. The highest speed ever obtained for the same power. The highest mean efficiency when running from half to full gate.* We guarantee also: *A runner of the greatest possible strength. A gate unequaled in quickness and ease of opening and closing.*

Test of a 45 in. SAMSON, Jan. 25, '97.

Gate Open.	Head.	Rev. Pr. Min.	Cu. Ft. Pr. Sec.	Horse Power.	Per Cent.

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 159 pp. Price $1.00.

This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. Cloth bound; fully illustrated. Price $1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price $1.00.

This book describes the construction of the various forms of transmitting and receiving devices, the signalling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and here the result of long practical work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 5x7 pp. 288 illustrations. Price $1.50.

In this book the writer has endeavored to produce a manual of a strictly up-to-date and thoroughly practical, and detailed, so far as space will allow, the most recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McManamin, edited by Prof. C. H. Haskins. Sixth edition. 16mo, 50 pp. Price 25 cents.

This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price $2.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 508 pages, 323 illustrations. Price $4.00.

HOW TO MAKE AND USE THE TELEPHONE. By Geo. H. Guy. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price $1.00.

TELEPHONES, THEIR CONSTRUCTION AND FITTING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 192 pp., 163 illustrations. Price $2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 169 illustrations. Price $4.00.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 35 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages. 22 illustrations. Price $1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 736 pages. 356 illustrations. Price $4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Hounsell. Translated from the original papers of the inventor and contemporary publications. 182 pages. 3 plates and 8 engravings. Price $3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY, treating on the telegraph, telephone, etc. By E. J. Houston. 339 pages. 88 illustrations. Price $1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

ELECTRICITY FOR ENGINEERS.

Latest Edition, Now Published in One Complete Volume, 424 Pages, Profusely Illustrated.
Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

PART I. CONTENTS.—CHAPTER I: Electricity; Positive and Negative; Conductors, Non-Conductors and Insulators; Electro-Motive Force; Volts; Resistance; Ohms; Current; Amperes.—CHAPTER II: Dynamos; Magnets; Field Coils; Electro Magnets; Permanent Magnets.—CHAPTER III: Armatures; Construction of, Different Kinds of; Commutator; How Made and Connected; Heating of Armatures; Eddy Currents.—CHAPTER IV: The Current; How Produced; Induction; Series Wound Dynamos; Shunt Wound Dynamos; Exciting the Fields.—Constant Current and Constant Potential Dynamos; Series and Parallel; Parallel or Multiple Arc System.—CHAPTER V: Incandescent Lamps; Filaments; Connections; Flashing; Exhausting; Testing; Candle Power; Operated in Series; Automatic Cut-Out; In Multiple Arc or Parallel; Multiple Series; Multiple Series Cut-out; Three Wire System.—CHAPTER VI: The Arc Light; How Formed; Causes of Unsteadiness; Remedy; Effect of Shades or Globes; Shape of Carbons; Under Different Conditions of Burning; Arc Lamps; Regulating and Cut-out Mechanism; Action of Current; Clutch Lamps; Clockwork Lamps; Double Lamps; Trouble in Lamps.—CHAPTER VII: Commutators and Brushes; The Commutators; Construction; Different Styles of Brushes; Double Brushes; Single Brushes; Troubles with Commutators and Brushes; Correct Position of Brushes; Sparking at Brushes; Care of Brushes and Commutators; Flashing.—CHAPTER VIII: Current Regulation; Hand Regulation; By Position of Brushes; Resistance Box; Resistance Coils.—CHAPTER IX: American System of Automatic Current Regulation; The Dynamo, Regulator; Action of Regulator.—CHAPTER X: Brush System of Automatic Current Regulation, Brush Armature; Diagram of Circuits through Dynamo, Regulator and Lamps; Dial or Regulator; Care and Adjustment of Dial; Dial Controller; Circuits and Connections of No. 8 Brush Dynamo.—Circuits of Compound Wound Constant Potential Brush Dynamo.—CHAPTER XI: The Edison System; Automatic Regulator; Circuits of Regulator.—Details of Dynamo; Action of Regulator, Recoil Pressure Indicator; Diagram of Circuits; Description of Parts and Operation.—CHAPTER XII: Excelsior System of Automatic Current Regulation; Dynamo; Armature; Diagram of Circuits.—The Regulator and Motor; Action of Regulator.—CHAPTER XIII: Schuyler System of Automatic Current Regulation; Dynamo; Armature; Commutator and Brushes; Diagram of Circuits in Armature and Field; Regulator; Circuits in Regulator.—CHAPTER XIV: Thomson Houston System of Automatic Current Regulation; Dynamo; Armature; Commutator and Brushes; Controlling Magnet; Wall Controller; Diagram of Circuits.—Details.—CHAPTER XV: Waterhouse System of Three-Brush Automatic Current Regulation; Dynamo; Extra Brush; Resistance Coils and Regulator.—CHAPTER XVI: Ampere-Meters; Tangential Scale; Solenoid Meters.—CHAPTER XVII: Voltmeters; Pressure and Potential Indicators.—CHAPTER XVIII: Testing; Galvanometers; Needles; Electrolytic Apparatus.—CHAPTER XIX: Wheatstone Bridge or Electrical Balance; Diagram of Circuits and Methods of Use; Bridge and Rheostat.—CHAPTER XX: Testing Dynamos; Testing the Magnets as a Testing Instrument; Armature; Field; Bell; Diagram of Circuits.—CHAPTER XXI: Coupling Dynamos Together; In Series; In Shunt; Series, Shunt and Compound Wound Machines.—CHAPTER XXII: Switches and Switchboards; Loop Switch; Plug and Socket, Change Over Plug and Socket; Conclusion.—CHAPTER XXXIII: Electric Motors; General Principles the Same as in Dynamos; Types; Shunt and Series Motors Suitable for all General Purposes; Regulation of Shunt Motors; of Series Motors; Counter E. M. F.; Direction of Rotation and Direction of Current; Starting Motors; Diagram of Connection.

PART II. CONTENTS.—CHAPTER I: Alternate Current Dynamos; Principles of the Field; Field Current Armature; Winding; Connections; Lamination; Different Types of Alternators; Regulation; Leading Systems; The Brush Generators; Magnets; Armature; Principles of Induction.—CHAPTER II: Dynamo, Quadruped; The Mosley Alternator, Stationary Armatures; Field Magnets; Ferranti Armature; Field Magnets; Winding; Collectors.—CHAPTER III: Dynamos Concluded; Siemens Dynamo; Rod Magnetic Circuits; Stanley Constant Current Dynamo; The Armature; Self Induction; Regulation.—CHAPTER IV: Induction Coils; Converters; Transformers; Economy of Distribution; An Electrical H. P.; Losses in Conductor; Induction Coils; Effect of Induction, Transformers.—CHAPTER V: Transformers Continued; Induction Coils; Converters; Transforming Up and Down; Design of Transformers; The Static Charge; Protection Against; Grounding the Secondary; Other Devices; The Foil Protector; Different Types of Transformers.—CHAPTER VI: Transformers, Concluded; Fuses; Regulation; Winding of Transformers; Connecting to Circuit; Regulation; Safety Fuses.—CHAPTER VII: Parallel System; Series Arc Light System, Diagram of Circuits; Parallel System; Primary Circuit; Secondary Circuit; Placing of Transformers, Fuses, Diagram of Series Arc Light Circuit.—CHAPTER VIII: Lines of Force; Hysteresis; Magnetic Perception; The Circuit of Lines of Force; Experiments with Magnet; Rapidity of Reversals and Hysteresis.—CHAPTER IX: Arc Lamps; In Series; The Westinghouse Arc Lamp; Diagram of Circuits in Lamp, Action of the Mechanism; Flat Carbons.—CHAPTER X: Arc Lamps, in Multiple; Shaffery Differential Lamp; Mechanism of Lamp; Its Operation.—CHAPTER XI: Measuring and Indicating Apparatus; Instruments for Use with Alternating Currents Differ from those used with Continuous Currents; Ammeters; Voltmeters; Description of Several Forms of Instruments.—CHAPTER XII: Measuring Instruments, Continued; Hot Wire Instruments; The Cardew Voltmeter, Details of the Instrument; Low Potential Voltmeter.—CHAPTER XIII: Voltmeters, Double Coil Voltmeter; Two Types.—CHAPTER XIV: Spring Meters, Curled Spring Meter.—CHAPTER XV: Twisted String Instruments; Diagram of Connections and Operation of Instrument.—CHAPTER XVI: Recording Meters; Stanley Meter; Construction and Principles of Operating; Diagrams of Parts; Slattery Induction Meter; Description of Parts and Principles of Operation.—Wait Meter; Thomson Meter.—CHAPTER XVII: Generators in Parallel; Difficulties in Operating; Alternate Current Generators in Parallel; Arrangements of Circuits and Machines for Operating in Parallel; Diagram of Common Arrangement of Machines and Circuits.—CHAPTER XVIII: Ohm's Law; Strength of Current; Formulas and Examples; Power and Heating Effects of Currents.—CHAPTER XIX: Ground Alarms and Leak Detectors.

PRICE, $2.50.

CATALOGUE FO ANY ADDRESS.

A Voice from Chicago. . . .

"The Warren Alternator was put in operation September, 1895, and has proven all that we expected of it. . . . .
It runs almost noiselessly, develops no heat and is wonderfully simple in its operation; in efficiency and regulation we believe it is as high as possible. The bearings are simply perfection and do not heat or give trouble in any respect. We honestly believe the Warren Alternator to be the most advanced type of alternating current machine now known.—Famous Manufacturing Co., Chicago."

WARREN ELECTRIC MANUFACTURING CO.,

SANDUSKY, OHIO.

TRADE MARK:
"Chloride Accumulator"
REGISTERED SEPTEMBER 11, 1894.

CHLORIDE ACCUMULATORS

Of 1,200 H. P. Hours Capacity, are Being Installed for

THE BUFFALO RAILWAY COMPANY.

This Battery will be used for regulating the load at the Power House. It will work in conjunction with the steam plant and the Niagara Falls power with which the station is provided. At night the battery will be fully charged with Niagara Falls power which otherwise would be wasted, and during those hours of the day when the load is excessive it will discharge to assist the generating plant.

THE ELECTRIC STORAGE BATTERY CO.,

Drexel Building, PHILADELPHIA, PA.

BRANCH OFFICES: NEW YORK, 20-22 Broad St. BOSTON, MASS., 60 State St. *Catalogues.* CHICAGO, ILL., 1543 Marquette Bldg. SAN FRANCISCO, CAL., 222 Market St.

IS IT GOOD MANAGEMENT to install high grade machinery in your station and low grade lamps on your lines, the lamp being the END, AIM and TEST of the lighting system? If this is suggestive and you now want to adopt a strictly high grade lamp, try the

"HARDY"—Sustained Candle Power Is Its Strong Point.

To prove it we will send by express, charges prepaid, one dozen 16 c. p. lamps, any base, any voltage from 45 volts to 125 volts, for $2.16. AGENTS WANTED. CORRESPONDENCE SOLICITED.

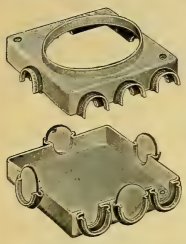
STEEL BOXES.

STEEL SPLIT BOXES FOR 5-8 CONDUIT.



NOTE the good points of this box!
NOTE that it is non-breakable!
NOTE the length of the projecting lugs!
NOTE that the inner rim of outlet is smaller than the outer!
NOTE from this that the conduit cannot run too far into box!
NOTE the removable discs!
NOTE that it weighs but 21 ounces!

If you have noted well all these good points you will have discovered the Best Split Conduit Box on the Market. Our new Catalogue "D" will tell you about our other 1,200 styles of Steel Outlet Boxes. We also manufacture Steel Boxes for Panel Boards.

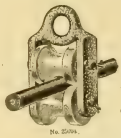
DIEHL MANUFACTURING CO.,
ELIZABETHPORT, N. J.

The Swinging Tree Insulator

Manufactured by
WESTERN ELECTRIC COMPANY.



This Tree Insulator will thoroughly protect your lines from swaying branches without cutting the insulation.

It is readily hung from a hook or wire twisted through the loop at the top, and by lengthening the wire can be adapted to a wide range of conditions.

It can be used with advantage for supporting arc light wires under iron roofs.

WESTERN ELECTRIC COMPANY,

FAST SELLING BOOKS OF MERIT.

A MINE OF TECHNICAL INFORMATION

For the Practical Electrician,
The Professor,
The Student,
And *anyone* interested in *any way* in the science.

AN ABSOLUTELY NEW WORK.
Complete and Unabridged.

The Pocket Electrical Dictionary

4th Edition.

By EDWIN J. HOUSTON, A. M., Ph. D. (Princeton).

A most valuable contribution to electrical literature.
This new Dictionary is destined to enjoy a world-wide sale. It contains over 11,000 words and about 15,000 definitions used in the science. There are several thousand new words now used in the science that have never appeared in any other single book.
It is indispensable to all electricians.
It is beautifully printed on fine paper, and is so compact that it can be carried in the pocket.
The type is large and clear. 550 pages.

1 Vol., 32mo, Cloth, $2.50; Leather, $3.00.
Sent post-paid on receipt of price.

A NEW AND VALUABLE WORK.

Electricity Made Easy

BY SIMPLE LANGUAGE
AND COPIOUS ILLUSTRATION

By EDWIN J. HOUSTON, A. M., Ph. D., and ARTHUR E. KENNELLY, Sc. D.

TABLE OF CONTENTS.

Chap.
I. The Turning of an Electric Lamp in the House.
II. How the Electric Wires are Distributed Through the House.
III. How the Electric Street Mains Supply the House.
IV. How the Street Mains are Supplied with Electricity.
V. The Electric Lighting Station.
VI. How the Incandescent Lamp Operates.
VII. How the Incandescent Lamp is Made.
VIII. How the Electric Current Supplied to the House is Measured.
IX. How the Arc Lamp Operates.
X. How the Light of Electric Lamps is Best Distributed.
XI. The Voltaic Cell and How it Operates.
XII. The Electric Bell and How it Operates.
XIII. The Electric Telegraph and How it Operates.
XIV. How the Dynamo Operates.
XV. How the Electric Motor Operates.
XVI. The Telephone and How it Operates.
XVII. Some Other Applications of Electricity.

The authors have taken great pains to tell the story of electricity in a clear, comprehensive style so that beginners and laymen cannot fail to be greatly benefited by reading this new work.
Many analogies are given which simplify what is usually a difficult technical subject. The authors are famous for their ability in explaining technical matters, without the use of the higher mathematics. Whether you make the science of electricity your profession or not, much knowledge can be gained by reading this work, as it gives anyone a clear idea of the application of electricity.

1 Vol., 12mo, Cloth, over 200 Illustrations and 300 Pages, $1.50.
Sent post-paid on receipt of price.

A VALUABLE AID TO STUDENTS.

The Interpretation of Mathematical Formulæ

By EDWIN J. HOUSTON, Ph. D.,
and ARTHUR E. KENNELLY, Sc. D.

With Diagram Illustrations.

A new work for students' use and to aid all who are educating themselves on the higher mathematics. Invaluable to the engineer and electrician.

THE CONTENTS INCLUDE:

Chap.
I. Addition.
II. Subtraction.
III. Multiplication.
IV. Division.
V. Involution. Powers.
VI. Evolution. Roots.
VII. Equations.
VIII. Logarithms.
IX. Trigonometry.
X. Hyperbolic Trigonometrical Functions.
XI. Differential Calculus.
XII. Integral Calculus.
XIII. Determinants.
XIV. Synopsis of Symbols.

Prof. Forbes of England, in speaking of Dr. Kennelly's work, says: "Of all the beautiful expositions of profound mathematical work in the simplest language which can be understood by any student in our technical colleges, there is nothing in the literature of the day to come up to the writings of Dr. Kennelly."

1 Vol., 12mo, Cloth, $1.25.
Sent post-paid on receipt of price.

A B C of Electricity

By WILLIAM H. MEADOWCROFT.

Indorsed by THOS. A. EDISON.

This excellent primary book has taken the first place in elementary scientific works. It has received the indorsement of Thomas A. Edison. It is for every person desiring a knowledge of electricity, and is written in simple style so that a child can understand the work. It is what its title indicates, the first flight of steps in electricity.

WHAT THE PRESS SAYS.

"A clear and comprehensive little treatise."—N. Y. Sun.
"Electric science is making magnificent strides and this book fills a useful office in setting forth the features and characters of these advances."—Brooklyn Times.
"The need of such a book has undoubtedly been felt by many. . . . We predict for it a splendid sale."—The Age of Steel.
"A book like this should be largely read."—N. Y. Herald.
"The book is well illustrated, and no pains have been spared to make it accurate and reliable throughout."—Electrical Review.
"In simple language the author lays bare the secrets of electrical science and application."—Electrical World.
"A vast amount of useful information."—Washington Post.

From the Laboratory of Thos. A. Edison, Orange, N. J.

Mr. W. H. Meadowcroft, New York City.
Dear Sir:—I have read your MS. of the "A B C of Electricity," and find that the statements you have made therein are correct. Your treatment of the subject and arrangement of the matter have impressed me favorably.
Yours truly,
THOS. A. EDISON.

108 Pages, Illustrated, 12mo, Cloth Binding, 50 cents.
Sent post-paid on receipt of price.

PHYSICIANS, SURGEONS AND DENTISTS
Find an Important Work in

CATAPHORESIS

OR

Electric Medicamental Diffusion

AS APPLIED IN MEDICINE, SURGERY AND DENTISTRY.

By WILLIAM JAMES MORTON, M. D.
AUTHOR OF
The X-Ray; or Photography of the Invisible, etc.

This is the only work published on the subject and is indispensable to all members of the medical profession. The work is profusely illustrated with fine engravings and diagrams showing the applications of cataphoretic instruments.
The contents are:

INTRODUCTION.

Part I—Historical.—Early Experimenters. Modern Revival. Development in Dental Surgery. The Writer's Contributions.
Part II—Physics and Physiology. Elementary Electrical Principles. Sources of Electricity. Simple or Chemical Osmosis. Electrical Osmosis or Cataphoresis. Electrolysis and Cataphoresis. Physiological Experiments.
Part III—Apparatus and Outfit.—Electrodes for Medicinal Diffusion. Electrodes for Metallic Electrolysis. Dental Electrodes. Batteries. Rheostats. Medicaments. Central Station Circuits.
Part IV—Applications in Dental Surgery.—Anæsthetization of Sensitive Dentine. Anæsthesia of the Gums. Anæsthesia or Sterilization of the Teeth. Diffusion from Soluble Electrodes.
Part V—Applications in Medicine and General Surgery.—Simple Cataphoresis. Cataphoric Medication or Electric Medicamental Diffusion. Electro-Cocaine Local Anæsthesia. Electric Diffusion from Soluble Electrodes.

1 Vol., Large 8vo, Illus., Cloth, $4.00; Half Leather, $5.00.
Sent post-paid on receipt of price.

A Most Important Work of General Interest.

FIFTH THOUSAND.

THE X-RAY

Or Photography of the Invisible
and Its Value in Surgery.

By WILLIAM J. MORTON, M. D.
Written in Collaboration with
EDWIN W. HAMMER.

With Valuable Appendices by Prof. Roentgen, Thomas A. Edison and Dr. Oliver Lodge.

This work gives full information of Professor Röntgen's marvelous discovery. The work explains in clear and simple style how the extraordinary pictures are taken through solids. Full description is given of the apparatus used, and the text is profusely illustrated with half-tone illustrations giving fac-simile copies of the pictures taken from the negatives of the author. The subjects are varied. One shows distinctly a bullet lodged in a man's hand for which the surgeon has probed without success. The X-ray showed the bullet at once and the surgeon had no difficulty in removing it. The text is beautifully illustrated with these wonderful X-ray pictures. The book is of inestimable value to the physician and surgeon, the photographer and scientific student, but will be largely read by the public generally, for the subject is most fascinating and instructive. It is unquestionably the most important scientific discovery of all times.
Nearly 100 excellent X-ray pictures and diagram illustrations. Colored plate showing rays in Crookes tube. The entire work beautifully printed on coated paper.

1 Vol., 12mo, Cloth and Silver, 75 cents; Paper, 50 cents. Fully Illustrated.
Sent post-paid on receipt of price.

CREOSOTED WOOD CONDUITS
FOR UNDERGROUND WIRES.
FOR TELEPHONE, TELEGRAPH AND ELECTRIC LIGHT COMPANIES.

There are advantages in using CREOSOTED WOOD CONDUITS not obtained in using any other kind; cables will not be scratched by being drawn through them; no concrete foundation, sides or top required; wires in creosoted wood conduits are most easily reached between manholes; subways constructed with creosoted wood conduits in less time than by any other. In parks and on boulevards they are the best because vegetable growth is prevented, keeping roots away from cables.

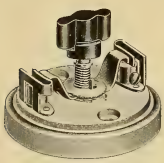
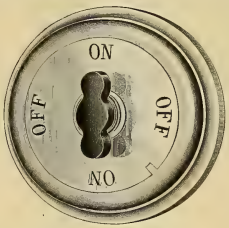
SWITCH BOARDS.
SWITCHES AND PANEL BOARDS.

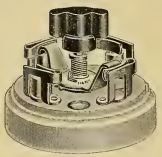
Hart Switches for 500 Volt Circuits.



No. 20½. 5 Ampere, S. P.



No. 21½. 10 Ampere, S. P.



No. 23½. 5 Ampere, 3-Way.

These switches are guaranteed to work on 500 volt circuits without causing trouble or "playing out."

No. 21½ is especially designed for electric heaters.

Continued orders from customers who have used these switches for years is convincing proof that they perform their work in a satisfactory manner.

For particulars, see our illustrated catalogue.

All switches of our manufacture are stamped "Hart Switch" on the metal.

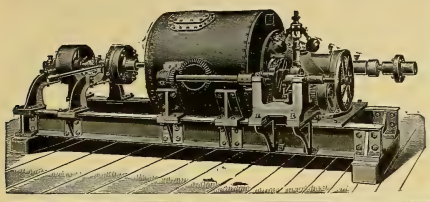
Victor Turbine Water Wheel.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter,** being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

SEND FOR CATALOGUE AND PARTICULARS.

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to connect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts and where the situation admits of their use we recommend them.

THE MOTOR ENGINEERS' AND ELECTRICAL WORKERS' HAND-BOOK.
By WM. LINTERN.

The Motor Engineers' and Electrical Workers' Hand-Book is compiled with a view of furnishing a book of reference in a simple and convenient form for the use of motor engineers and street railway men. The diagrams of controller connections and combinations will be found of great value in practical work. The methods of testing are both simple and reliable. The author is indebted to the Westinghouse, General Electric, Walker and Steel Motor companies for information cheerfully furnished.

TABLE OF CONTENTS.

Chapter I. Elementary Principles. Units, Ohm's Law, Watt, Kilowatt, Ampere, Turn, Hour, etc. Potential, E. M. F., Voltage, Drop of Potential, Resistance (Ohmic), Conductivity. **Chapter II.** Magnetism and Electro-Magnetic Induction. **Chapter III.** Calculation of Circuits, Principles of Circuits, Series, Shunt, Parallel or Multiple Arc, Joint Resistances of Parallel Circuits, Multiple Series, Series Multiple. **Chapter IV.** Dynamo-Electric Machine, General Principles, Field Magnets, (Varieties), Series, Shunt, Compound, etc. Short Shunt, Long Shunt. **Chapter V.** Instructions for Operating Generators. Running a Single Generator, To Shut Down a Machine. Running in Multiple, Sparking, Polarity, Excitation Grounds, Generators in Multiple, Connections, Running Generators in Multiple. To Shut Down a Machine Running in Multiple. **Chapter VI.** The Electro-Motor General Principles, Counter Electromotive Force and Mechanical Power, Efficiency. **Chapter VII.** Measurements and Tests of Street Railway Motors. Faults, Measurement by Drop of Potential, Method (Examples), Insulation Tests, Voltmeter Method, Use and Care of Voltmeter and Ammeter. The Wheatstone Bridge, Instructions for Operating, Drop of Potential in Motor Circuits. **Chapter VIII.** Instructions for Operating Car Apparatus. Brushes, Sparking at Brushes, Bearings, Reading Fuse Block, Operating Car, Trolley, etc. **Chapter IX.** The Electric Motor Car in Detail. Series, Parallel, Controller, Reverse Switch, Rheostat, Fuse Box, Lightning Arrester, Heaters. **Chapter X.** Definitions of Terms. **Chapter XI.** Diagrams of Car Wiring and Controllers, with Written Descriptions and Diagrams of Combinations. Westinghouse System, No. 12, No. 28 and 28 A). General Electric (K, with W. P. Machines, K 2. General Electric Series Parallel Controller with Magnetic Brake). Walker System (H2 E). Steel Motor Co. System. **Chapter XII.** General Electrical and Mechanical Information. Belting, Shafting, Pulleys and Gears, Melting Point, Specific Gravity and Relative Conductivity, Table Comparing Wire Gauges, Number, Dimensions, Height, Length and Resistance of Pure Copper Wire, Electrical Units and Formulæ, Equivalent Carrying Capacity, Proportions of Four Teeth, Notes Bill of Material for Span Wire Construction (Single Track) (Double Track), Bracket Construct on, (Strings End, Bracket Pole) (Double Track).

190 pages. Handsomely bound in cloth, $1.00 Heavy boards, 50c. Sent on receipt of price

The Lockwood Transmitter

Is protected by letters patent No. 528640 and No. 557588, issued Nov. 6, 1894, and April 7, 1896, respectively.

The electrodes have "A variable air space" between them, and the adjustment is obtained by tension instead of pressure. The Lockwood is positively the only Transmitter on the market having no contact BETWEEN electrodes, consequently parties liable to infringement suits and promoters of long-distance systems will find it to be the only telephone that will satisfy the fears of their subscribers. The Transmitter can be placed upon any instrument now in use, and an exchange of Transmitters is easily effected.

Address:

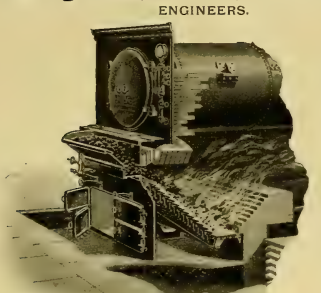
Westinghouse, Church, Kerr & Co.,
ENGINEERS.



Managers of Electric Light and Power Stations are getting more and more alert to the smaller economies in the generation of power. They are alive to the fact that their finished product is power, and therefore they install expensive boilers, efficient engines and generators, and often pay considerable attention to their steam piping; but how many who are doing all this are practically nullifying it all by improper firing? Do they not know that every time the fire door is opened it cools off the fire, wastes coal and injures their boilers?

The Roney Mechanical Stoker obviates all this, enables one to use a cheaper grade of fuel and at the same time to derive the best results from the excellent machinery which receives its power from this service.

If you would know more of this standard piece of apparatus, address:

PROF. A. C. PERRINE, Leland Stanford University, Cal.
PROF. GEO. D. SHEPARDSON, University of Mont.
A Comprehensive Treatise in Simple Language, free from Algebraic Equations and Easily Understood. And others.

TABLE OF CONTENTS:

1. The nature and properties of electricity.
2. Machines for generating electricity by friction and by electric induction.
3. Electric batteries or appliances for generating electricity by chemical action.
4. Electric batteries or appliances for generating electricity by chemical action (concluded).
5. The magnetic effects of electric currents, magnetic fields.
6. The magnetic effects of electric currents, and magnetic circuits.
7. Ohm's law of the flow of electricity.
8. Heating effects of electric currents. Miscellaneous effects of electric currents.
9. Galvanometers and voltameters.
10. Measurement of electrical resistance.
11. Everyday measurements of electric currents and pressures.
12. Everyday measurements of electric power. Condensers and the measurement of their capacity.
13. Electrolytic deposition of metals.
14. The electric telegraph.
15. Multiple telegraphy.
16. The telephone.
17. The construction of telegraph and telephone lines and instruments.
18. Testing lines for insulation and conductivity and the location of leaks and breaks.
19. Principles of continuous current dynamos and motors.
20. Principles of continuous current dynamos and motors, their construction, care and attendance.
21. Arc lighting and arc light machinery.
22. Incandescent lighting and power transmission, two three and five wire systems of distribution for electric lights and motors.
23. Construction of electric light and power circuits and their testing.
24. Testing electric light circuits, and the distribution and measurement of light.
25. Electromagnetic induction.
26. Alternating currents.
27. Alternating currents and alternating current machinery (concluded).
28. Miscellaneous applications of electric motors.
29. Electric railways.
30. Methods of handling and controlling railway motors and generators.
31. Model electric plants.
32. Underwriters' rules, etc.
33. Electric welding, forging, etc.; electricity applied to the kitchen.
34. Electro-therapeutics.

Transformer Economy.

THE CHANGE AT CONSHOHOCKEN, PA.

The Diagram shows part of the map of **Conshohocken, Pa.**, where **25 Small Transformers** (●) were replaced by **2** of our **Type H** (■) Transformers.

THE RESULT OF THE CHANGE:

Core loss of 25 Small Transformers,	1664
Core loss of the 2 Type H Transformers,	238
Saving in Watts,	**1426**

You cannot afford to continue the use of old, small, individual Transformers, when a change to new methods will bring about such results.

It will pay you to use **Type H Transformers.** You can operate your plant with less coal, with better regulation, and increase the station capacity by the amount saved in core losses.

A TECHNICAL EDUCATION 50 CENTS A WEEK.

The new installment plan of The International Correspondence Schools, Scranton, Pa.—the largest and most successful institution teaching technical subjects by mail—places an education within the reach of all. Students may enroll upon paying $2 in advance, the balance to be paid at the rate of $2 a month. The charges are moderate and include all necessary text-books. Studies are carried on at home without loss of time from work.

The Electrical Power and Lighting Scholarship is a thorough course of instruction in the installation, care and operation of electric light, power and railway plants designed to meet the wants of busy men who wish to put into actual practice as soon as possible the information they acquire.

The Mechanical-Electrical Scholarship includes instruction in mechanical and electrical engineering and is intended especially for those who wish to become designers of electrical machinery.

Also 43 courses including Steam Engineering, Mechanical Drawing, Machine Design, Civil Engineering, Bookkeeping, Shorthand and English branches.

Write for circular, stating subject in which you are interested.

G. & H. BARNETT COMPANY,

PHILADELPHIA, PA.

WE OFFER TO THE PUBLIC A NEW AND MARVELLOUS ELECTRIC CABLE,

Standardized in sizes for, and adapted to, all interior electric wiring adaptation. It is the only cable in the world combining Fire and Burglar alarm protection with all other interior electric wiring work, in same installation.

We confine ourselves to the manufacture and sale of this cable exclusively, it being auxiliary to all other electric interests.

By the use of this cable every infinitesimal part of every wire hereafter installed for whatever purpose in all buildings is made a detective point for the discovery and automatic notification of fire. We have opened up a new and rich field for the electrical contractor. If you are not acquainted with us and the cable, you should be. Write or call and become so.

Write for illustrated and descriptive printed matter.

We own the sole and exclusive right to manufacture and sell the Montauk Multiphase Cable and Central Station Controller, by virtue of the following patents: No. 546,261, Sept. 10, 1895; No. 546,262, Sept 10, 1895; No. 565,053, Aug. 4, 1896; No. 565,178, Aug. 4, 1896; No. 565,188, Aug. 4, 1896; No. 565,217, Aug. 4, 1896; No. 565,410, Aug. 4, 1896; No. 584,034, Nov. 23, 1897; No. 594,247, Nov. 23, 1897; No. 594,281, Nov. 23, 1897, which broadly cover not only the method of manufacturing, but the basic principle upon which these cables are constructed.

DIEHL

ENCLOSED ARC

LAMPS

MOST IMPROVED TYPE FOR DIRECT CURRENT CIRCUITS.
HIGHEST DEVELOPMENT IN ELECTRICAL DESIGN.

SHOWROOMS:

561-563 Broadway, New York.
192-194 Van Buren Street, Chicago.
128-132 Essex Street, Boston.

DIEHL MANUFACTURING CO.,
ELIZABETHPORT, N. J.

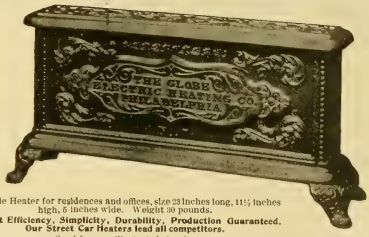
The American Electric Meter Co.,

9th St. and Montgomery Ave., Philadelphia, Pa.,

Is now prepared to take orders for early delivery of all sizes of 3-Wire Constant Potential Registering Meters.

This meter is calibrated ready for instant use.
This meter requires no knowledge of electricity to erect.
This meter shows the load passing every instant.
This meter is hermetically sealed.
This meter measures correctly with uneven loads.
This meter can be calibrated with a watch in six minutes.
This meter requires no lubrication.
This meter is magnetically shielded.
This meter is direct reading, having no multiplier.
This meter does not require one-thousandth of a horse power.
This meter will operate for years without opening.
This meter has no springs, jewels or frictional errors.
This meter once right is always right.

ELECTRIC HEATERS AVAILABLE TO ALL. MINIMUM EXPENSE.



Portable Heater for residences and offices, size 23 inches long, 11½ inches high, 6 inches wide. Weight 30 pounds.

Highest Efficiency, Simplicity, Durability, Production Guaranteed. Our Street Car Heaters lead all competitors.

Send for new illustrated circular.

Heating coils renewed like incandescent lamps. Constructed for any voltage. Work on direct or alternating current. Consumes 6.8 amperes on 110 volt current, 1.5 on 500 volt current.

THE GLOBE ELECTRIC HEATING CO., 147 North 12th Street, Philadelphia, Pa.

The Best System of Belting in the World

Compared with Straight Belts - - - { Easier on bearings, Smaller per cent. of slip, One-half the space.

Compared with Clutches - - - - { Less expense, More efficient in operation, Great saving in space.

Compared with Direct Coupling - { About the same floor space, Cost much smaller, Easier to keep in repair.

Write for Further Particulars.

Paper Insulated Cable.

THE ONLY

CABLE FOR HIGH TENSION SERVICE.

READ THE FOLLOWING TESTIMONIALS:

TWIN CITY RAPID TRANSIT CO.,
CONTROLLING
THE STREET RAILWAY SYSTEMS
OF
MINNEAPOLIS AND ST. PAUL.

MINNEAPOLIS, February 14th, 1898.

THE NATIONAL CONDUIT & CABLE COMPANY,
TIMES BUILDING, NEW YORK.
EDWIN REID, SUPERINTENDENT OF CONSTRUCTION.

DEAR SIR:—In accordance with our contract, your company has installed a complete conduit and cable system.

The conduits, some 120,000 duct feet, were accepted in August, 1897.

The four transmission cables, some 90,000 feet, have now been tested as per contract. They have stood the strain and tests and are hereby pronounced satisfactory.

We would call particular attention to the St. Paul cable. This cable, over nine miles long, carried 18,000 volts alternating current for over eight hours. After this test, the high potential switches were broken on 12,000 volts, when the cable was transmitting 700 horse power. These tests were very severe. New conditions were met; new methods of testing adopted and valuable data collected as to the proper handling and installation of high potential cables.

The St. Paul cable is now in regular service transmitting 2,000 H. P. nine miles by the three-phase 12,000 volt system.

Yours truly,

EDWARD P. BURCH, Electrical Engineer,
Twin City Rapid Transit Co., and the St. Anthony Falls Water Power Co.

MINNEAPOLIS MILL COMPANY
AND
ST. ANTHONY FALLS WATER POWER COMPANY,
INCORPORATED 1856.

MINNEAPOLIS, MINN., February 15th, 1898.

NATIONAL CONDUIT & CABLE COMPANY,
TIMES BUILDING, NEW YORK.

GENTLEMEN:—We hereby formally accept the four lines of your lead covered 3-conductor, paper insulated, high potential power cables, which you furnished and installed in the four cement-lined conduit ducts which were also furnished and constructed by you in this city and to St. Paul, 10¼ miles distant.

We take pleasure in testifying to the fact that the severe tests upon your cables have shown the superiority of your cable; and we have good reason to congratulate your company, as well as ourselves, upon the satisfactory results obtained.

Appreciating the broad-gauged manner in which you have carried on your work during the installation of our plant and the very satisfactory way in which you have handled all our affairs, we remain

Very respectfully,

ST. ANTHONY FALLS WATER POWER CO.,
By WM. de la BARRE, Engineer, Agent and Treasurer.

WE HAVE FURNISHED ALL THE CABLES FOR THE LACHINE RAPIDS HYDRAULIC & LAND CO., OF MONTREAL, ALSO LARGE QUANTITIES TO THE CATARACT POWER & CONDUIT CO., OF BUFFALO.

Write us for Information Regarding Cables and Conduits for Any Kind of Service.

The National Conduit & Cable Co.,

TIMES BUILDING, NEW YORK.

Rookery, Chicago, Ill. Ames Building, Boston, Mass.

"OH, PA! PA! — LOOK AT WHAT THAT AD. STUDIO MAN DID!"

Important....

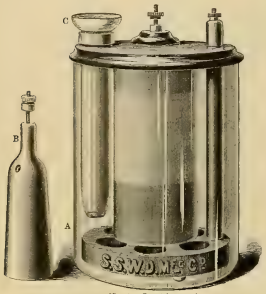
P. S. Bear in mind, we simply spoiled a good picture to impress upon you **that we carry the largest stock of Telephone Supplies** in our territory, and make the promptest shipments, as **all goods** can be shipped from **stock in St. Louis.**

P. S. We do not handle telephone instruments.

The Partz Acid Gravity Battery

PATENTED AUG. 17, 1886; DEC. 7, 1886.

For Long-Distance and Continuously Used Telephones, Electric Signals, Electric Clocks, Watchmen's Clocks, etc.



No. 3. Jar 6 in. x 8 in.

E. M. F., 1.9 to 2 volts on open circuit. PRICE OF CELL, $1.50 EACH.

Partz Sulpho-Chromic Salt.

Patented March 6, 1888.

Sulpho-Chromic Salt is, as its name indicates, a combination of sulphuric and chromic acids in an amorpho-crystalline state, the efficacy of which is attested by the superiority of the batteries based upon its use.

It was specially devised for use with the Partz Acid Gravity Batteries. Its high specific gravity causes it to sink to the bottom of the jar, where it remains, forming a dense depolarizing solution, which, unless disturbed, will not rise, and therefore does not attack the zinc, so that the battery remains for long periods on open circuit without loss of efficiency.

Sulpho-Chromic Salt, when dissolved in water, makes a standard electropoion fluid without the necessity of handling liquid acids, having practically the same amount of stored energy as an equal quantity of fluid made in the ordinary ways, giving with a zinc-carbon element an E. M. F. of 1.9 to 2 volts, and an ampere-hour capacity of about the same.

Sulpho-Chromic Salt is put up in air-tight jars with screw lid, each jar containing two pounds. As the salt is hygroscopic, it must be guarded against moisture

Price per jar, 2 lbs., - $0.75.

SEND FOR CATALOGUE.

The Partz Acid Gravity Battery combines the advantages of the gravity and Bunsen types. It is a two-fluid cell, using the elements and fluids of the Bunsen, with the gravity principle of the Callaud. Its principle is readily understood from the illustration. The carbon plate (*a*) lies on the bottom of the jar; the zinc (*b*) is suspended near the top. The jar being filled with a solution of common salt or sulphate of magnesia, Partz Sulpho-Chromic Salt is added through the funnel (*c*). This dissolves, forming a depolarizing solution, which on account of its greater density remains at the bottom, surrounding the carbon plate, and away from the zinc, constituting the second fluid, and separated from the other by gravity only.

It has a high voltage, 1.9 to 2 volts, and very little polarization, when properly used.

It furnishes a practically constant current until the fluid is completely saturated with the products of the chemical action, up to which time the addition of Sulpho-Chromic Salt through the funnel whenever the battery shows signs of weakening will **immediately restore its strength.**

When not in use it will stand for months on open circuit without appreciable waste, and always ready for instant service. The zinc, the only part that ever wears out, is only acted upon when the battery is producing current, and will last from one to four years, according to use.

Charging it is a cleanly and safe operation, because there are no liquid acids to handle. It is the cleanest, strongest, most effective, most reliable, and most economical open-circuit battery before the public.

The Following Letters Tell the Story of the Battery:

THE NEW YORK AND NEW JERSEY TELEPHONE CO.

ELIZABETH, October 5, 1893.

The S. S. White Dental Mfg. Co., 12th and Chestnut Sts., Philadelphia.

GENTLEMEN:—Yours of 3d inst. to hand and contents noted. In reply, I beg to state that we connected the Partz Batteries in circuit at our busiest long-distance subscriber's office (Borne & Scrymser Co.), at Elizabethport, N. J., on June 23, 1893. The first charge lasted until August 19. At that date we recharged the glass funnel; this charge lasted until September 19. The battery had not run down, but the red solution had nearly disappeared.

In my opinion, they are the batteries for the telephone business, especially for long distance and connections that take a great deal of time.

Borne & Scrymser Co. use their phone as long as one and one-quarter of an hour without ceasing; half an hour very often. So you see I placed the batteries where they would be subjected to a severe test. Yours respectfully,

CHARLES M. ROOT, Manager.

OFFICE OF THE NEW YORK AND NEW JERSEY TELEPHONE CO.

MANAGER'S OFFICE, ELIZABETH, July 9, 1895.

The S. S. White Dental Mfg. Co., Philadelphia.

GENTLEMEN:—Your letter of the 5th inst. to hand and contents carefully noted, and in reply I beg to say that you may add to my letter of February 26, 1895, that from February 15 to April 12 there was no attention needed; on that date we added "Kronite" or Chromic Salts. May 14 renewed batteries, and we have done nothing since.

In twenty-five months we have renewed the batteries *twice*. The zincs and carbons have never been changed. The adding of Chromic Salts every other month keeps the batteries to their work—no dirt, no trouble, and in my estimation they are the best batteries for long-distance telephoning, and especially for subscribers who use their phones often and for long connections. Yours, etc.,

CHARLES M. ROOT, Manager.

THE S. S. WHITE DENTAL MFG. CO.,

Philadelphia, New York, Boston, Chicago, Brooklyn, Atlanta, Rochester, Berlin (Germany), Buenos Ayres, R. A.

WE OFFER TO THE PUBLIC A NEW AND MARVELLOUS ELECTRIC CABLE,

As Reliable as a Galvanometer, as Infallible in Action, and Continuously Thermostatic.

Standardized in Sizes for all Interior Electric Adaptations. It is the only cable in the world combining Fire and Burglar Alarm protection with all other interior electric wiring work, in same installation. We confine ourselves to the manufacture and sale of this cable exclusively, it being auxiliary to all other electric interests.

By the use of this cable every infinitesimal part of every wire hereafter installed for whatever purpose in all buildings is made a detective point for the discovery and automatic notification of fire. We have opened up a new and rich field for the electrical contractor. If you are not acquainted with us and the cable, you should be. Write or call and become so.

Write for illustrated and descriptive printed matter.

We own the sole and exclusive right to manufacture and sell the Montauk Multiphase Cable and Central Station Controller, by virtue of the following patents: No. 546,261, Sept. 10, 1895; No. 546,262, Sept 10, 1895; No. 565,053, Aug. 4, 1896; No. 565,178, Aug. 4, 1896; No. 565,188, Aug. 4, 1896; No. 565,217, Aug. 4, 1896; No. 565,410, Aug. 4, 1896; No. 594,034, Nov. 23, 1897; No. 594,247, Nov. 23, 1897; No. 594,281, Nov. 23, 1897, which broadly cover not only the method of manufacturing, but the basic principle upon which these cables are constructed.

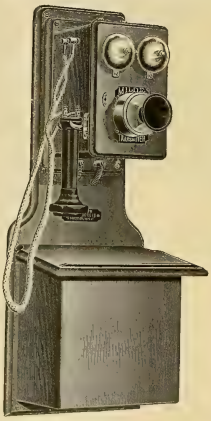
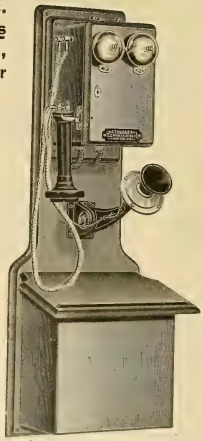
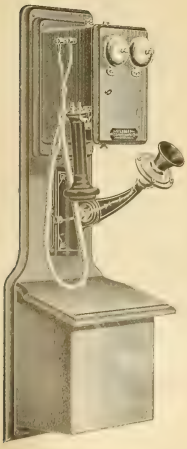
MANUFACTURERS, Importers and Dealers in Telephones, Switchboards, Transmitters, Receivers, Batteries, Magneto Bells, and Telephone Apparatus of all Kinds and for all Conditions or Requirements of Service.

YEARS

Of successful and satisfactory operation warrant us in claiming the highest possible efficiency for our apparatus. Our oldest customers are our best advertisers, a claim which no other manufacturer can honestly make.







300 Exchanges
50,000 Telephones

All in satisfactory operation to-day. is the record we can point to with justifiable pride, and which should be an object lesson to prospective investors in the telephone business.

ALL OF OUR APPARATUS

is long past the experimental stage and is headed by the **UNRIVALLED**

MILDÉ TRANSMITTER

which has received **GOLD MEDALS** and **TESTIMONIALS** for superiority over all competitors at the leading **WORLD'S EXPOSITIONS** in late years.

THE GREAT TELEPHONE BATTERY

TRADE **GONDA** MARK.

The Standard Open Circuit Batteries Of The World.

For more than a quarter of a century the GONDA TRADE MARK CELLS have stood at the head and been recognized as the model in all attempts at rivalry. In all that time the standard has never been lowered and the GONDA TRADE MARK CELLS have never been equaled. The reason is:

FIRST. The Use of the Purest Materials Obtainable.
SECOND. The Exercise of the Utmost Care in Workmanship.
THIRD. The Exclusive Knowledge of the Only Way to Make Them.

BEWARE OF IMITATIONS AND INFRINGEMENTS.
THESE ONLY ARE GENUINE.

11 Broadway, NEW YORK.

RED TAPE

Sometimes causes friction, but for Great Adhesion, High Insulation and Imperviousness to Moisture use

SIMPLEX FRICTION TAPE.

This tape is prepared with great care of good material. A trial will convince you of its qualities. A sample roll is free for the asking. You need not purchase until you are convinced.

Western Electric Company, CHICAGO. NEW YORK.

CREOSOTED WOOD CONDUITS

HAVE BEEN IN USE SINCE 1884 AND ARE IN AS GOOD CONDITION AS WHEN LAID.

There are advantages in using **CREOSOTED WOOD CONDUITS** not obtained in using any other kind; cables will not be scratched in being drawn through them; no concrete foundations, sides or tops required; wires in creosoted wood conduits are most easily reached between man-holes; subways constructed with creosoted wood conduits in less time than by any other; in parks and on boulevards they are best because vegetable growth is prevented, keeping roots away from cables.

WE USE ONLY DEAD OIL OF COAL TAR.

TURNED ORNAMENTAL POLES.

We turn ornamental poles for electric lights or any purpose and furnish them plain, painted or creosoted. Send us your plans and get our prices.

CREOSOTED CROSS ARMS.

Just take up this matter of creosoting your cross arms with us. We think you will be convinced of the economy of using creosoted cross arms. Write us for prices.

A TECHNICAL EDUCATION 50 CENTS A WEEK.

The new installment plan of The International Correspondence Schools, Scranton, Pa.—the largest and most successful institution teaching technical subjects by mail—places an education within the reach of all. Students may enroll upon paying $5 in advance, the balance to be paid at the rate of $2 a month. The charges are moderate and include all necessary text-books. Studies are carried on at home without loss of time from work.

The Electrical Power and Lighting Scholarship is a thorough course of instruction in the installation, care and operation of electric light, power and railway plants designed to meet the wants of busy men who wish to put into actual practice as soon as possible the information they acquire.

The Mechanical-Electrical Scholarship includes instruction in mechanical and electrical engineering and is intended especially for those who wish to become designers of electrical machinery.

Also 13 courses including Steam Engineering, Mechanical Drawing, Machine Design, Civil Engineering, Bookkeeping, Shorthand and English branches.

Write for circular, stating subject in which you are interested.

NOTICE.

The Honorable William J. Allen, judge of the Circuit Court of the United States at Springfield, Illinois, handed down a decision in the case of Addie F. Ide, *et al.*, Executors, *vs.* Chuse, *et al.*, on the twenty-first of December, sustaining the validity of the following patents:

No. 308,498, for Steam Engine Governors, granted November 25th, 1884, to Albert L. Ide.

No. 321,726, for Steam Engine Cross-head Lubricators, granted July 7th, 1885, to Albert L. Ide.

No. 396,209, for Engine-frames, granted January 15th, 1889, to Albert L. Ide.

No. 400,682, for Lubricating Device for Steam Engines, granted April 2nd, 1889, to Albert L. Ide.

These patents cover the governor, engine-frame, cross-head lubricator and self-oiling system which has become known to the public in connection with the "Ideal" engine. Manufacturers and users of engines embodying the features covered by these patents are notified that they will be held to account for infringement.

A Mine of Technical Information for the Practical Electrician, the Professor, the Student, and *anyone* interested in *any way* in the science.

An Absolutely New Work. Complete and Unabridged.

The Pocket Electrical Dictionary.

FOURTH EDITION.

BY EDWIN J. HOUSTON, A. M., PH. D. (PRINCETON).

A most valuable contribution to electrical literature.
This new dictionary is destined to enjoy a world-wide sale. It contains over 11,000 words and about 15,000 definitions used in the science. There are several thousand new words now used in the science that have never appeared in any other single book.
It is indispensable to all electricians.
It is beautifully printed on fine paper, and is so compact that it can be carried in the pocket.
The type is large and clear. 950 pages.

1 Vol., 32mo, Cloth, $2.50; Leather, $3.00. Sent postpaid on receipt of price.

AMERICAN TECHNICAL BOOK CO.,

PUBLISHERS, 45 VESEY STREET, NEW YORK.

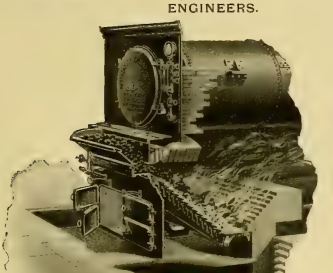
Smoke Stacks, Tanks, Etc., and All Classes of Iron Work.

Specifications, Drawings and Prices furnished on application.

Send for Catalogue of Climax and Compound Boilers.

Westinghouse Machine Company, MANUFACTURERS.

Westinghouse, Church, Kerr & Co., ENGINEERS.



Managers of Electric Light and Power Stations are getting more and more alert to the smaller economies in the generation of power. They are alive to the fact that their finished product is power, and therefore they install expensive boilers, efficient engines and generators, and often pay considerable attention to their steam piping; but how many who are doing all this are practically nullifying it all by improper firing? Do they not know that every time the fire door is opened it cools off the fire, wastes coal and injures their boilers?

The Roney Mechanical Stoker obviates all this, enables one to use a cheaper grade of fuel and at the same time to derive the best results from the excellent machinery which receives its power from this service.

If you would know more of this standard piece of apparatus, address

NEW YORK, 26 Cortlandt St. BOSTON, Westinghouse Bldg.
CHICAGO, 171 La Salle St. DETROIT, Union Trust Bldg.
PHILADELPHIA, M. R. Muckle, Jr. & Co., Drexel Bldg.

Patented Telephony.

A review of patents pertaining to Telephones and Telephonic Apparatus.

CONTENTS: Introductory.—Percentage of Patents Sustained.—Supreme Court Decisions.—Berliner Case.—Induction Coil.—Drawbaugh Cases.—Hunnings-Transmitter.—Subscribers' Calls.—Switchboards.—Law System.—Mann System.—Multiple Board.—Express System.—Ravenel-Hess System.—Comparative Advantages.—Multiple and Divided Board Systems.—Carney Plug Board.—Brief Mention.—Automatic Switchboards.—Conclusions.—Index.

ELECTRICITY AND MAGNETISM.

A series of thirty-four lessons covering the Science of Electricity from its Fundamental Principles to its Everyday Practical Application. Comprises 325 pages, over 300 diagrams and illustrations. Price $2. By

PROF. D. C. JACKSON, University of Wisconsin.
PROF. H. S. CARHART, University of Michigan.
PROF. E. F. THOMAS, University of Ohio.
PROF. WM. A. ANTHONY, of New York.
PROF. BROWN AYRES, Tulane University.
PROF. A. C. PERRINE, Leland Stanford University, Cal.
PROF. GEO. D. SHEPARDSON, University of Minn.
And others.

A Comprehensive Treatise in Simple Language, Free from Algebraic Equations and Easily Understood.

TABLE OF CONTENTS:

1. The nature and properties of electricity.
2. Machines for generating electricity by friction and by electric induction.
3. Electric batteries or appliances for generating electricity by chemical action.
4. Electric batteries or appliances for generating electricity by chemical action (concluded).
5. The magnetic effects of electric currents, magnetic fields.
6. The magnetic effects of electric currents, and magnetic circuits.
7. Ohm's law of the flow of electricity.
8. Heating effects of electric currents. Miscellaneous effects of electric currents.
9. Galvanometers and voltameters.
10. Measurement of electrical resistance.
11. Everyday measurements of electric currents and pressures.
12. Everyday measurements of electric power. Condensers and the measurement of their capacity.
13. Electrolytic deposition of metals.
14. The electric telegraph.
15. Multiple telegraphy.
16. The telephone.
17. The construction of telegraph and telephone lines and instruments.
18. Testing lines for insulation and conductivity and the location of leaks and breaks.
19. Principles of continuous current dynamos and motors.
20. Principles of continuous current dynamos and motors, their construction, care and attendance.
21. Arc lighting and arc light machinery.
22. Incandescent lighting and power transmission, two, three and five wire systems of distribution for electric lights and motors.
23. Construction of electric light and power circuits and their testing.
24. Testing electric light circuits, and the distribution and measurement of light.
25. Electromagnetic induction.
26. Alternating currents.
27. Alternating currents and alternating current machinery (concluded).
28. Miscellaneous applications of electric motors.
29. Electric railways.
30. Methods of handling and controlling railway motors and generators.
31. Model electric plants.
32. Underwriters' rules, etc.
33. Electric welding, forging, etc.; electricity applied to the kitchen.
34. Electro-therapeutics.

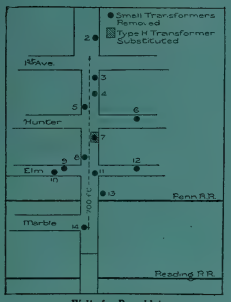
Transformer Economy No. 2.



Write for Pamphlet
"USE AND ABUSE OF TRANSFORMERS."

THE CHANGE AT CONSHOHOCKEN, PA.

Last week we showed the results of a change in transformer practice at Conshohocken, Pa., in which two Type H Transformers superseded 25 small Transformers of old make and effected a saving of 1,426 watts. In a part of the same district (diagram No. 2) one Type H Transformer superseded 14 small ones of old make.

RESULT OF THE CHANGE:

Core loss of 14 small Transformers,	886
Core loss of one Type H Transformer,	124
Saving in Watts,	**762**

Before the change the voltage varied from 52 to 58 volts. After the change no variation was perceptible at either end of the secondary mains or directly at the Transformer.

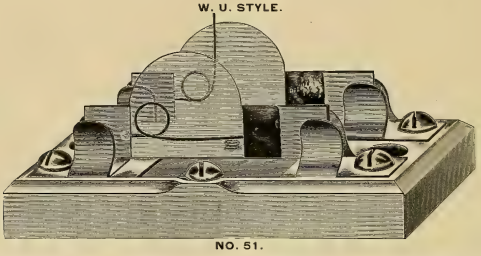
Maxstadt Combination Double Pole Porcelain Fusible Cut-Out Lightning Arrester.

W. U. STYLE.

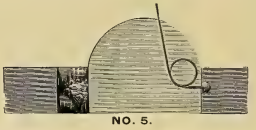


NO. 51.

This combination is so arranged that it forms a protection against the three dangerous currents: high-tension arc or trolley current, which forms a short circuit, the sneak current and lightning.

No. 51 is the same block which is used on the regular Maxstadt Combination Double Pole Porcelain Fusible Cut-Out Lightning Arrester. The improvement is in the Fuse.

NO 4.



NO. 5.

No. 4 represents the improved Fuse when closed. No. 5 represents the Fuse when open. This Fuse is guaranteed to protect the instrument from lightning, short circuit or sneak current. It is the only combination Fuse and Fusible Cut-Out Lightning Arrester in existence to-day that will protect the 'phone against the above currents.

Address all communications to

AMERICAN ELECTRIC FUSE CO., 87 and 89 Washington St., Chicago, Ill.

NOTHING MORE WELCOME

At Midday or Midnight than a **Perfect Telephone System.**

WE HAVE IT!

Realizing the great demand for a Perfect Telephone System from the Central Station Switching Apparatus to the least important part of the Telephone itself, we have aimed to supply this demand.

We now have to offer a Switchboard far superior both in construction and operation to anything thus far devised.

Drops and Jacks are Combined, are Self-Contained, Interchangeable and can be removed from the board in the fraction of a minute.

We use No Clearing Out Drops, No Switchlevers or Calling Keys cut into the Cord Circuits.

A call is answered, shutter reset, party wanted called up and necessary connections made in Two Moves, viz., the act of placing plugs in spring jacks.

Consider what this means—Less Operators, Quicker Service, Larger Dividends. Can you ask for more?

These Boards from 4 to 1,000 drops are now in daily operation throughout the United States.

Do Not Forget that we also make over 25 different styles of Phones to meet all requirements, also a full line of Supplies pertaining to the Telephone business.

If you are interested send us your request for our '98 catalogue, which will be ready for distribution shortly.

WHITMAN & COUCH,

196 SUMMER STREET, BOSTON, MASS.

WILHELM TELEPHONE MFG. CO.,

BUFFALO, N. Y.

Although we only recently made our bow to the telephone public, our new Double Diaphragm Telephone Transmitter is already in great demand and is recognized by experts as containing features that place it far ahead of all others. It is so simply constructed that it cannot get out of order even though subjected to very rough usage.

The Wilhelm Double Diaphragm Transmitter

Is an Entirely New Production,

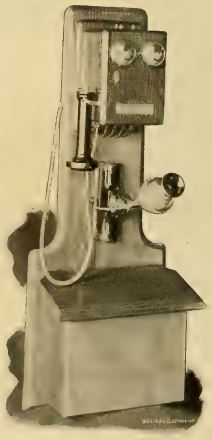
And radically differs from anything on the market. It contains two floating diaphragms which vibrate towards each other upon a common variable resistance, thus doubling the power and sensitiveness of the transmitter.

It is mechanically and electrically perfect and is absolutely non-infringing. The diaphragms are made of carbon, but are not clamped down at their edges, so that the breakage of diaphragms resulting from mechanical strain is absolutely impossible. The diaphragm is free to vibrate over its entire surface, and consequently is more sensitive to the different modulations of the voice. The diaphragms cannot be broken by pounding in the mouthpiece with a pencil, as they are around the corner out of harm's way.

We Manufacture Over thirty different styles of complete telephone outfits for public exchange, private line and interior systems. All our instruments are characterized by their durability, efficiency and beauty of design. Every instrument is equipped with our double diaphragm transmitter and is thoroughly tested by an expert before leaving the factory.

We Make a Specialty of Re-Equipping Exchanges whose apparatus is worn out or for other reasons not up to the standard of modern telephony. Correspondence solicited.

This is an exact reproduction of our Standard Long Distance Exchange Instrument No. 2, especially adapted for long lines, exchange use and on lines where the inductive disturbance is very great.



The Wilhelm Telephone Mfg. Co.,

BUFFALO, N. Y.

WALTER L. WILHELM, Proprietor.

Estimates, Plans, Specifications and Supervision for

TELEPHONE PLANTS.

Opinions on Patents. Patents Obtained.

On telephone systems about to be installed we can give you full information as to cost, electrical requirements and as to the best apparatus and material for indoor and outdoor construction. It will save money to do the calculating *before* a large force of men is under pay.

Plants already in operation will be carefully studied, defects and dangers exposed and remedies suggested, with a view of improving service, decreasing operating expenses and increasing revenue and profits.

For Preliminary Consultation (Oral or by Mail) No Charge.

THERE ARE

2,300 Independent Telephone Exchanges

IN THE UNITED STATES.

They should be equipped with the

HATCH STORAGE BATTERY.

WHY?

Because

1st: The highest efficiency for the work required, with the greatest strength and life of any Storage Battery manufactured.

2nd: Cost of maintenance one-half that of any Storage Battery on the market and weighs one-half less than any Storage Battery offered for sale.

3rd: We can help you pay dividends by saving upon equipment of the telephone exchange or individual telephone box.

WE DO NOT INFRINCE.

We guarantee all purchasers against damages by infringement suits.

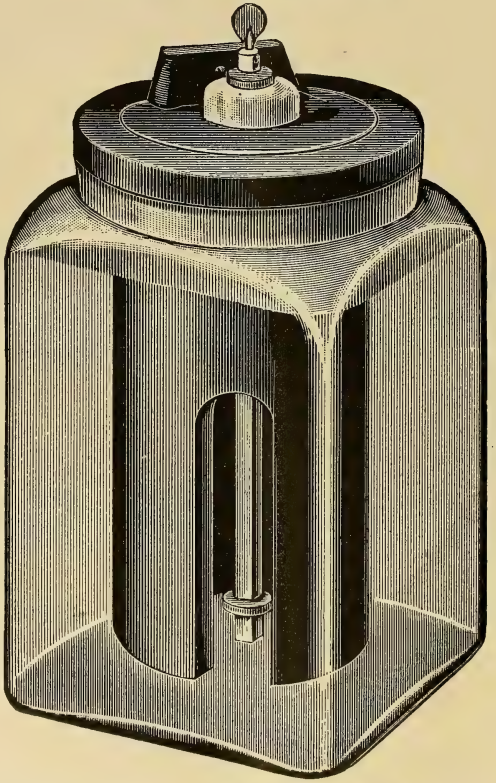
LACLEDE CARBON BATTERY.



HERCULES CARBON BATTERY.

TRADE "LACLEDE" MARK.

TRADE HERCULES MARK.

OVER 2,000,000 OF THESE BATTERIES IN USE!

Adopted by Over 700 Telephone Exchanges. Highest Grade Carbon, Non-Corrosive Connectors, Best Refined Zinc, Extra Heavy Jars, German Sal-Ammoniac, an Honest, Staple Product.

MANUFACTURED BY THE

Laclede Battery Company,

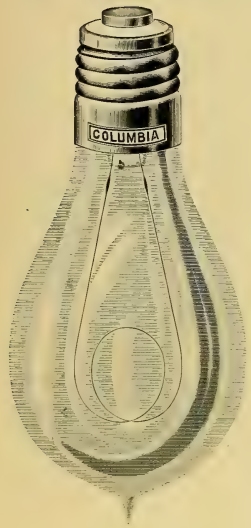
SOLE MANUFACTURERS OF THE LACLEDE AND HERCULES BATTERIES,

KOKOMO, INDIANA.

Largest Exclusive Manufacturers of Carbon Batteries in the United States.

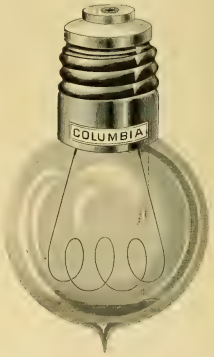
COLUMBIA LAMPS

UNEQUALED IN QUALITY.



We solicit the business of central stations and isolated plants on the claims for superiority of Columbia Lamps which we are prepared to carry out in actual service.

The filaments used in our product are made in our own factory under our own supervision; and the detail followed in every department of the factory, and the care used in the proper selection of lamps, makes it possible for us to guarantee Columbia Lamps absolutely uniform in every respect.



Send us a trial order and be convinced that our claims are well founded.

Special prices on annual contracts where requirements equal or exceed 1,000 lamps.

Prompt shipments from factory and branch offices.

The Columbia Incandescent Lamp Company,

Main Office and Factory: 1910, 1912, 1914 Olive Street, St. Louis, Mo.

New York Office: 711 Havemeyer Bldg. **Chicago Office: 1236 Monadnock Bldg.**
San Francisco: Paul Seiler Electrical Works.

A Cold Fact

HARD TO GET AROUND.

THE

Western Telephone Construction Co.,

250 S. CLINTON ST., CHICAGO,

Has to date built over five hundred telephone exchanges in the United States (averaging each at least 100 drops), and it is constantly receiving additional increase orders from these exchanges. This fact and the instruments

"SPEAK FOR THEMSELVES."

Why then, when you're planning your exchange or buying additional equipment, will it not pay you to ascertain the reason for OUR SUCCESS?

Important Telephone Books.

THE TELEPHONE HANDBOOK. By Herbert Laws Webb. 16mo, 159 pp. Price $1.00.
This handbook is a complete treatise on telephony, and a practical book on telephone working and management, based entirely on standard American practice. It is extremely useful to telephone inspectors and operators.

PATENTED TELEPHONY. A Review of the Patents Pertaining to Telephones and Telephonic Apparatus. Published by the American Electrical Engineering Association. [illegible] Second, fully Illustrated. Price $1.50.

THE ELECTRIC TELEPHONE. By E. J. Houston, Ph. D., and A. E. Kennelly, Sc. D.; 12mo, cloth, 422 pp., 142 illustrations. Price $1.00.
This book describes the construction of the various forms of transmitting and receiving devices, the signaling mechanisms, and the switchboard apparatus at the central station. It is written by two well-known electricians, and has the merit of being the latest work on the subject.

THE PRACTICAL TELEPHONE HANDBOOK. By Joseph Poole, A. I. E. E. Second edition, revised and enlarged. 520 pp. 388 illustrations. Price $1.50.
In this work the writer has endeavored to produce a manual of moderate size and cost, but thoroughly practical, and detailing, as far as space will allow, the most recent methods of telephone working. While the requirements of telephone employes have been kept constantly in view, it is fully intended also that the book shall be of service as a source of information on telephonic matters to users of the telephone and to the public generally.

TELEPHONE TROUBLES AND HOW TO FIND THEM. A complete handbook for telephone inspectors. By W. Hyde and J. H. McJunkin, edited by Prof. C. H. Haskins. Sixth edition. 16mo, 59 pp. Price 25 cents.
This little volume is an extremely practical work for telephone employes, written in a popular style and devoid of technicalities.

TELEPHONE LINES AND THEIR PROPERTIES. By Wm. J. Hopkins. Second edition. 272 pp. Illustrated. Price $1.50.

A MANUAL OF TELEPHONY. A new and large edition. By W. H. Preece, F. R. S., and A. J. Stubbs. 868 pages. 333 illustrations. Price $4.50.

HOW TO MAKE AND USE THE TELEPHONE By Geo. H. Cary. The purpose for which this book is written is to furnish information to those who may desire to construct or use telephone apparatus or lines on a small scale. Price $1.00.

TELEPHONES, THEIR CONSTRUCTION AND FITTING. A Practical Manual on the Fitting Up and Maintenance of Telephone and Auxiliary Apparatus. By F. C. Allsop. 191 pp., 168 illustrations. Price $2.00.

TELEPHONE SYSTEMS ON THE CONTINENT OF EUROPE. By Bennett. 436 pages. 169 illustrations. Price $4.50.

TELEPHONING OF GREAT CITIES. By Bennett. Paper. Price 25 cents.

MAGNETO HAND TELEPHONE. Its Construction, Fitting Up and Adaptability to Everyday Use. By Hughes. 80 pages. 23 illustrations. Price $1.00.

BELL'S ELECTRIC SPEAKING TELEPHONE. Its Invention, Construction, Application, Modification and History. By Prescott. New edition, revised and enlarged. 796 pages. 356 illustrations. Price $4.00.

PHILIPP REIS, INVENTOR OF THE TELEPHONE. A Biographical Sketch with Documentary Testimony. By Thompson. Translation of the original papers of the inventor and contemporary publications. 182 pages. 3 plates and 48 engravings. Price $3.00.

ELECTRICAL TRANSMISSION OF INTELLIGENCE AND OTHER ADVANCED PRIMERS OF ELECTRICITY, treating on the telegraph, telephone, etc. By E. J. Houston. 330 pages. 88 illustrations. Price $1.00.

The Above, or Any Other Electrical Works Published, Sent on Receipt of Price.

ELECTRICIAN PUBLISHING CO., 510 MARQUETTE BLDG., CHICAGO.

TO TELEPHONE AND ELECTRIC LIGHT COMPANIES:

We make a specialty of YELLOW PINE CROSS-ARMS, OAK and LOCUST PINS and BRACKETS. When desired will make delivered prices. Prompt shipments and satisfactory goods guaranteed. Write us.

J. W. Thomson, Jr. & Co.,

BEDFORD, INDIANA.

MANUFACTURERS OF TELEPHONES FOR ALL USES.

KNOWLEDGE IS POWER.

Everyone engaged in the electrical business should keep posted on the developments in the art by reading the latest books on the subject. We are headquarters in the West for electrical books and can fill orders for any work published, promptly on receipt of price. We call your special attention to the following standard books:

Allsop, F. C.—Electrical Bell Construction; Treatise on the Construction of Electric Bells, Indicators, and similar apparatus. 177 illustrations....$1.25

Angell, J.—Elements of Magnetism and Electricity, with Practical Instructions for the Performance of Experiments, and the construction of cheap apparatus. One hundredth thousand. 160 illustrations....$1.00

Atkinson, Philip.—The Elements of Electric Lighting. Seventh edition, fully revised, and new matter added. 104 illustrations. 260 pages....$1.50

Atkinson, Philip.—The Elements of Dynamic Electricity and Magnetism. 406 pages and 117 illustrations. Second edition....$2.00

Ayrton, W. E.—Practical Electricity; a Laboratory and Lecture Course for First-year Students of Electrical Engineering, based on the Practical Definitions of the Electrical Units. With numerous illustrations. Sixth edition....$2.50

Badt, Lieut. F. B.—New Dynamo Tenders' Hand Book. This is, as the name indicates, a **New Book**, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers, and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 226 pages, 140 illustrations, flexible cloth binding, size of type page 5½x3 inches....$1.00

Badt, Lieut. F. B.—Incandescent Wiring Hand-book. A timely book containing full illustrations for incandescent wiring and complete information concerning methods of running wires, location of safety devices, splices, insulation, testing for faults, wire gauges, general electrical data, calculating sizes of wires, wiring fixtures, elevators, buildings, isolated and central station plants. The only book of the kind published. Type page 5½x3 inches, flexible cloth binding, 66 pages, 35 cuts and 5 tables, 3 of which are 12x18 inches....$1.00

Badt, Lieut. F. B.—Bell Hangers' Hand-ook. Just the book for people engaged in selling, installing or handling electric batteries, electric bells, elevators, house or hotel annunciators, burglar or fire alarms, electric gas lighting apparatus, electric heat apparatus. 106 pages, 97 illustrations, flexible cloth binding. Type page 5½x3 inches.$1.00

Badt, Lieut. F. B.—Electric Transmission Hand-book. First edition, three thousand copies. 97 pages, 22 illustrations, 27 original tables....$1.00

Gives more *Practical* information on the subject than any work published to date The book contains all necessary information for Power Producers, Capitalists, Agents, Engineers and Motor Inspectors. With this book anybody may make estimates on the cost of Transmission Plants.

Bedell, Fred'k and Albert C. Crehore.—Alternating Currents; An Analytical and Graphical Treatment for Students and Engineers. Second edition. 112 illustrations....$2.50

Blakesley, T. H.—Papers on Alternating Currents of Electricity for the use of Students and Engineers. Third edition, enlarged. 12mo, cloth....$1.50

Bonney, G. E.—Electro-Plater's Hand Book. A Manual for Amateurs and Young Students on Electro-Metallurgy. 60 illustrations. 208 pages. 12mo, cloth....$1.25

Bottone, S. R.—Electrical Instrument Making for Amateurs. A Practical Hand-book, with 48 illustrations. Fourth edition. Enlarged by a chapter on the Telephone....$0.50

Bottone, S. R.—The Dynamo, How Made and How Used. A Book for Amateurs. Eighth edition, with additional matter and 39 illustrations....$1.00

Bottone, S. R.—Electro-Motors. How Made and How Used. A Handbook for Amateurs and Practical Men. Reduced to $0.50

Bottone, S. R.—How to Manage the Dynamo. A Hand-book for Ship Engineers, Electric Light Engineers and Electro-Platers....$0.60

Buckley, W. J.—Electric Lighting Plants, their cost and operation. 275 pages, many illustrations and diagrams
Cloth....$2.00
Paper....1.00

Cox, Frank P.—Continuous Current Dynamos and Motors. An Elementary Treatise for Students and Engineers. Illustrated....$2.00

Crocker, F. B., and Wheeler, S. S.—The Practical Management of Dynamos and Motors. With a special chapter by H. A. Foster. Illustrated. Second edition, revised and enlarged....$1.00

Crosby, O. T., and Dr. Louis Bell.—The Electric Railway in Theory and Practice. A Complete Treatise on the Construction and Operation of Electric Railways, Second edition, revised and enlarged. 183 illustrations....$2.50

Desmond, Chas.—Electricity for Engineers Part I. Constant Current. A clear and comprehensive treatise on the principles, construction and operation of Dynamos, Motors, Lamps, Indicator and Measuring Instruments; also a full explanation of the electrical terms used in the work Part II. Alternate Current Apparatus. Containing an explanation of the principles governing the generation of, and a description of the instruments and machinery used in connection with Alternate Electric Currents. Illustrated. Revised edition....$2.50

Dyer, A.—Induction Coils. How Made and How Used. Third edition. Boards....$0.50

Fleming, J. A.—Short Lectures to Electrical Artisans. A course of Experimental Lectures delivered to a Practical Audience. Fourth edition. 74 illustrations....$1.50

Fleming, J. A.—The Alternate Current Transformer in Theory and Practice. Vol. I. The Induction of Electric Currents, 500 pages, fully illustrated and with copious index. Second edition....$3.00

Synopsis of contents; Chapter 1. Introductory. 2. Electro-Magnetic Induction. 3. The Theory of Simple Periodic Currents. 4. Mutual and Self Induction. 5. Dynamical Theory of Current induction.

Vol. II. The Utilization of Induced Currents, 8vo. cloth. London, 1892....$5.00

Gore, G.—The Art of Electro-Metallurgy, including all Known Processes of Electro Deposition. Fourth edition....$2 00

Gordon.—School Electricity. Sources, Currents, Measurement, Telegraphy, Telephony, Lightning, Electrolysis, Induction, etc. 262 pages, with 140 illustrations....$2.00

Grier, Thos. G.—Wiring for Motor Circuits. A handy little pamphlet containing tables for wiring and for motor service, arranged in convenient form for ready reference.$1.00

Haskins, C. H.—The Galvanometer and its Uses. A Manual for Electricians and Students. Fourth edition, revised ..$1.50

Haskins.—Transformers. Their Theory, Construction and Application Simplified. 38 illustrations....$1.25

Hawkins, C. C. and F. Wallis.—The Dynamo, its Theory, Design and Manufacture. 190 illustrations....$3.00

Hering.—Practical Directions for Winding Magnets and Dynamos. 12mo. cloth, reprint without additions....$1.25

Hopkins, Geo. M.—Experimental Science. Elementary, Practical and Experimental Physics, 650 Illustrations $4.00

Hopkinson.—Original Papers on Dynamo Machinery and Allied Subjects. Illustrated....$1.00

Hopkinson, Dr. John.—Dynamic Electricity; Its Modern Use and Measurement, chiefly in its Application to Electric Lighting and Telegraphy....$0.50

Hospitalier, E.—Domestic Electricity for Amateurs, Translated from the French. With additions by C. J. Wharton. With illustrations....$2 50

Houston, Prof. E. J.—A Dictionary of Electrical Words, Terms and Phrases. Third edition, re-written and greatly enlarged. Large 8vo. 562 pages, and 570 illustrations $5.00

Kapp, Gisbert.—Electric Transmission of Energy and its Transformation, Subdivison and Distribution. A practical handbook. Third edition....$3.00

Kapp, Gisbert.—Alternate Current Machinery Illustrated.$0.50
[Vol. 96 Van Nostrand's Science Series.]

Kapp, Gisbert.—Alternating Currents of Electricity. Their Generation, Measurement, Distribution and Application. Authorized American ed. With an introduction by William Stanley, Jr. Illustrated....$1.00

Kapp, Gisbert.—Dynamos, Alternators and Transformers. 138 illustrations....$4.00

Kempe, H. R.—A Handbook of Electrical Testing. Fifth edition. 200 illustrations. 8vo. cloth. London, 1892....$7.25

In this edition there is a considerable amount of new matter; the old matter has been thoroughly revised.

Kempe, H. R.—The Electrical Engineer's Pocket Book. Modern Rules, Formulæ, Tables and Data. 32mo, leather $1.75

Lockwood, T. D.—Electricity, Magnetism and Electric Telegraphy. A Practical Guide and Handbook of General Information for Electrical Students, Operators and Inspectors. 376 pages, 152 Illustrations....$2.50

Lockwood, T. D.—Electrical Measurement and the Galvanometer; its Construction and Use. Second edition... $1.50

Lockwood, T. D.—Practical Information for Telephonists. 12mo, cloth. N. Y....$1.00

Meadowcroft, W. H.—The A. B. C. of Electricity. 36 Illustrations....$0.50

Martin, T. C.—Inventions, Researches and Writings of Nikola Tesla. With special reference to his work in polyphase currents and high potential lighting. 500 pp. 300 Illustrations, second edition....$4.00

Martin, T. C. and Wetzler, J.—The Electric Motor and its Applications. Third edition. With an Appendix on the Development of the Electric Motor since 1888. By Dr. L. Bell. 300 Illustrations....$3.00

Maver, and Davis, M. M.—The Quadruplex. With Chapters on the Dynamo-Electric Machine in Relation to the Quadruplex. The Practical Working of the Duplex Telegraph Repeaters and the Wheatstone Automatic Telegraph. 63 illustrations....$1.50

McClure, J. B.—Edison and his Inventions, with Full Explanations of the Telephone, Phonograph, Tasemeter, Electric Light and all his Principal Discoveries, etc..$1.00

Niaudet, Alfred.—Elementary Treatise on Electric Batteries, Translated from the French by L. M. Fishback. Illustrated....$2.50

Noll, Augustus.—How to Wire Buildings. A manual of the art of interior wiring. Illustrated....$1.50

Pope, Franklin Leonard.—Modern Practice of the Electric Telegraph. A technical Hand-book for Electricians, Managers and Operators. 185 illustrations. 14th edition, rewritten and enlarged....$1.50

Prindle, H. B—A Popular Treatise on the Electric Railway of to-day. Fully illustrated.... $0.25

Russell, Stuart A.—Electric Light Cables and Distribution of Electricity. 107 illustrations....$2.25

Salomons, Sir David.—Electric Light Installations. Vol. 1. The Management of Accumulators. A Practical Handbook. 7th edition, revised and enlarged. With illustrations. 12 mo, cl. London, 1893....$1.50

Sloane, T. O'Conner.—Electricity Simplified. The Practice and Theory of Electricity, including a Popular Review of the Theory of Electricity, with Analogies and Examples of its Practical Application in every-day life. Illustrated....$1.00

Sloane, T. O'Connor.—The Standard Electrical Dictionary. A Popular Dictionary of Words and Terms used in the practice of Electrical Engineering, 350 illustrations.$3.00

Sloane, T. O'Connor.—Electric Toy Making for Amateurs, including Batteries, Magnets, Motors, Miscellaneous Toys $1.00

Sloane, T. O'Connor.—The Arithmetic of Electricity. A Manual of Electrical Calculations by Arithmetical Methods, including numerous rules, examples and tables in the field of practical electrical engineering and experimenting. Third edition, revised....$1.00

Tesla, Nikola.—Experiments with Alternate Currents of High Potential and High Frequency. A lecture delivered before the Institution of Electrical Engineers, London. With a portrait and biographical sketch of the Author Illustrated....$1 00

Tesla, Nikola.—Lectures on the Electro-Magnet. Illustrated, ...$1.00

Thurston, Prof. R. H.—Stationary Steam Engines, especially adapted to Electric Lighting Purposes. Treating of the development of Steam Engines, the Principles of Construction and Economy, with description of Moderate and High Speed Engines. With many folding plates....$1.50

Thomson, Prof. Elihu.—What is Electricity? Illustrated.$0.25

Thompson, Sylvanus P.—Dynamo-Electric Machinery. A Series of Lectures, with an introduction by Franklin L. Pope. 16mo. Numerous illustrations, fancy boards (Van Nostrand's Science Series, No. 66)....$0.50

Thompson, Sylvanus P.—Polyphase Electric Currents and Alternate-Current Motors. Mailed to any address in the world on receipt of....$3.50

Thompson, Sylvanus P.—Recent Progress in Dynamo-Electric Machines, being a Supplement to Dynamo-Electric Machinery. 16mo. (Van Nostrand's Science Series, No. 75)....$0.50

Thompson, Sylvanus P.—Dynamo-Electric Machinery. Fourth edition, revised and rewritten. Numerous illustrations and 29 plates. 1,000 pages....$6 00

Trevert.—How to Make Electric Batteries at Home. Illustrated....$0.25

Urquhart.—Electro-Plating. A Practical Hand-book on the Deposition of Copper, Silver, Nickel, Gold, Aluminum, Brass, Platinum, etc. Second edition; carefully revised, with additions....$2.00

Walker, F.—Practical Dynamo Building, for Amateurs. How to wind for any output. With numerous illustrations. 16mo, boards. (Van Nostrand's Science Series, No. 98).$0.50

Webb, H. L.—A practical Guide to the Testing of Insulated Wires and Cables. Illustrated....$1.00

Webb, Herbert Laws.—Telephone Hand-book, Illustrated. 12mo, cloth. Chicago, 1895....$1.00

The only complete work on the Telephone. All possible information for any one interested in Telephones and how to make and operate them.

READ THE FOLLOWING TESTIMONIALS:

TWIN CITY RAPID TRANSIT CO.,
CONTROLLING
THE STREET RAILWAY SYSTEMS
OF
MINNEAPOLIS AND ST. PAUL.

MINNEAPOLIS, February 14th, 1898.

THE NATIONAL CONDUIT & CABLE COMPANY,
TIMES BUILDING, NEW YORK.
EDWIN REID, SUPERINTENDENT OF CONSTRUCTION.

DEAR SIR:—In accordance with our contract, your company has installed a complete conduit and cable system.

The conduits, some 120,000 duct feet, were accepted in August, 1897.

The four transmission cables, some 90,000 feet, have now been tested as per contract. They have stood the strain and tests and are hereby pronounced satisfactory.

We would call particular attention to the St. Paul cable. This cable, over nine miles long, carried 18,000 volts alternating current for over eight hours. After this test, the high potential switches were broken on 12,000 volts, when the cable was transmitting 700 horse power. These tests were very severe. New conditions were met; new methods of testing adopted and valuable data collected as to the proper handling and installation of high potential cables.

The St. Paul cable is now in regular service transmitting 2,000 H. P. nine miles by the three-phase 12,000 volt system.

Yours truly,

EDWARD P. BURCH, Electrical Engineer,
Twin City Rapid Transit Co., and the St. Anthony Falls Water Power Co.

MINNEAPOLIS MILL COMPANY
AND
ST. ANTHONY FALLS WATER POWER COMPANY,
INCORPORATED 1856.

MINNEAPOLIS, MINN., February 15th, 1898.

NATIONAL CONDUIT & CABLE COMPANY,
TIMES BUILDING, NEW YORK.

GENTLEMEN:—We hereby formally accept the four lines of your lead covered 3-conductor, paper insulated, high potential power cables, which you furnished and installed in the four cement-lined conduit ducts which were also furnished and constructed by you in this city and to St. Paul, 10½ miles distant.

We take pleasure in testifying to the fact that the severe tests upon your cables have shown the superiority of your cable; and we have good reason to congratulate your company, as well as ourselves, upon the satisfactory results obtained.

Appreciating the broad-gauged manner in which you have carried on your work during the installation of our plant and the very satisfactory way in which you have handled all our affairs, we remain Very respectfully,

ST. ANTHONY FALLS WATER POWER CO.,
By WM. de la BARRE, Engineer, Agent and Treasurer.

WE HAVE FURNISHED ALL THE CABLES FOR THE LACHINE RAPIDS HYDRAULIC & LAND CO., OF MONTREAL, ALSO LARGE QUANTITIES TO THE CATARACT POWER & CONDUIT CO., OF BUFFALO.

Write us for Information Regarding Cables and Conduits for Any Kind of Service.

The National Conduit & Cable Co.,

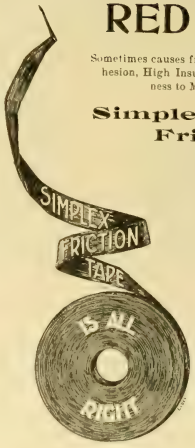
A HOT TIME | OUT OF THE QUESTION

BATES ELECTRIC FANS DO IT.

Wound for any Voltage Direct or Alternating.

D.L. BATES & BRO. DAYTON, O.

For Ceiling or Desk. A Written Guarantee with each FAN.



RED TAPE

Sometimes causes friction, but for Great Adhesion, High Insulation and Imperviousness to Moisture **USE**

Simplex Friction Tape.

This tape is prepared with great care of good material. A trial will convince you of its qualities. A sample roll is free for the asking. You need not purchase until you are convinced.

Western Electric Company,

CHICAGO.
NEW YORK.

Important....

P. S. Bear in mind, we simply spoiled a good picture to impress upon you **that we carry the largest stock of Telephone Supplies** in our territory, and make the promptest shipments, as **all goods** can be shipped from **stock in St. Louis.**

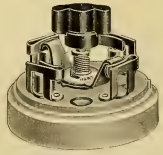
P. S. We do not handle telephone instruments.

"OH, PA! PA!—LOOK AT WHAT THAT AD STUDIO MAN DID!"

Hart Switches for 500 Volt Circuits.

No. 20½. 5 Ampere, S. P.

No. 21½. 10 Ampere, S. P.



No. 23½. 5 Ampere, 3-Way.

These switches are guaranteed to work on 500 volt circuits without causing trouble or "playing out."

No. 21½ is especially designed for electric heaters.

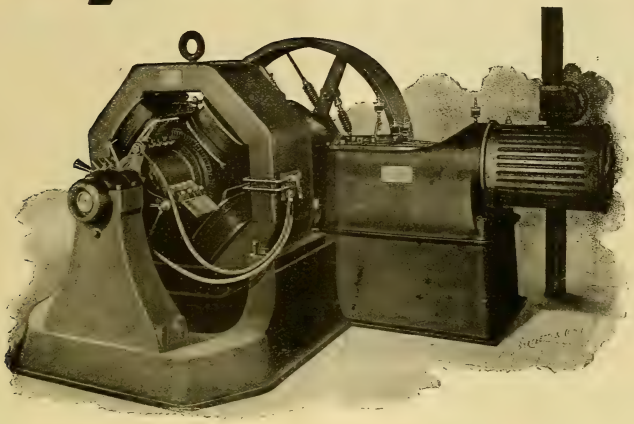
Continued orders from customers who have used these switches for years is convincing proof that they perform their work in a satisfactory manner.

For particulars, see our illustrated catalogue.

All switches of our manufacture are stamped "Hart Switch" on the metal.

THE HART & HEGEMAN MFG. CO., Hartford, Conn.

Eddy Generators



Direct Connected or Belted for Electric Railways, Central Stations, Isolated Lighting or Power Plants.

CROSS ARMS

CREOSOTED WILL LAST FOR MANY YEARS.
IT PAYS TO USE THEM.
—GET OUR PRICES.—

CREOSOTED WOOD CONDUITS

FOR UNDERGROUND WIRES.

FOR TELEPHONE, TELEGRAPH AND ELECTRIC LIGHT COMPANIES.

There are advantages in using CREOSOTED WOOD CONDUITS not obtained in using any other kind; cables will not be scratched by being drawn through them; no concrete foundation, sides or top required; wires in creosoted wood conduits are most easily reached between manholes; subways constructed with creosoted wood conduits in less time than by any other. In parks and on boulevards they are the best because vegetable growth is prevented, keeping roots away from cables.

THE ONLY
WATER-WHEEL GOVERNOR
THAT GOVERNS.

WATERVILLE & FAIRFIELD RAILWAY & LIGHT CO.,
WATERVILLE, ME., Jan. 18, 1896.

Lombard Water-Wheel Governor Co., Boston, Mass.

GENTLEMEN:—In regard to your Type C governor, which is regulating for us our two Hercules Wheels, which give power to operate our Light Plant, Street R. R. and Power Generator, we are frank to admit that the machine does its work admirably. We have no hesitancy in recommending it to those in want of a governor.

(Signed)
I. C. LIBBY, President Waterville & Fairfield R. R. & L. Co.

All of the street railway property of the

DEFIANCE LIGHT & RAILWAY COMPANY.

A splendid opportunity for interurban extension. For particulars address

W. R. FABEN, Receiver, Defiance, O.

In Going to St. Paul and Minneapolis

The wise traveler selects the Chicago, Milwaukee & St. Paul Railway.

Why?

It is the best road between Chicago and the Twin Cities.

It has the most perfect track.

Its equipment is the finest.

Its sleeping cars are palaces.

Its dining-car service is equal to the best hotels.

Its electric-lighted trains are steam heated.

Its general excellence has no equal

It is patronized by the best people.

It is the favorite route for ladies and children as well as for men.

It is the most popular road west of Chicago.

It gives the choice of seven trains daily.

City Ticket Office, 95 Adams St., Chicago.

The Lockwood Transmitter

Is protected by letters patent No. 528640 and No. 557588, issued Nov. 6, 1894, and April 7, 1896, respectively.

The electrodes have "A variable air space" between them, and the adjustment is obtained by tension instead of pressure. The Lockwood is positively the only Transmitter on the market having no contact BETWEEN electrodes, consequently parties liable to infringement suits and promoters of long-distance systems will find it to be the only telephone that will satisfy the fears of their subscribers. The Transmitter can be placed upon any instrument now in use, and an exchange of Transmitters is easily effected.

Address:

THE MOTOR ENGINEERS' AND ELECTRICAL WORKERS' HAND-BOOK.

By WM. LINTERN.

The Motor Engineers' and Electrical Workers' Hand-Book is compiled with a view of furnishing a book of reference in a simple and convenient form for the use of motor engineers and street railway men. The diagrams of controller connections and combinations will be found of great value in practical work. The methods of testing are both simple and reliable. The writer is indebted to the Westinghouse, General Electric, Walker and Steel Motor companies for information cheerfully furnished.

TABLE OF CONTENTS.

Chapter I.—Elementary Principles. Units, Ohm's Law, Watt, Kilowatt, Ampere, Turn, Hour, etc. Potential, E. M. F., Voltage, Drop of Potential, Resistance (Ohmic), Conductivity. **Chapter II.**—Magnetism and Electro-Magnetic Induction. **Chapter III.** Circuits: Varieties of Circuits, Series, Shunt, Parallel or Multiple Arc, Joint Resistances of Parallel Circuits, Multiple Series, Series Multiple. **Chapter IV.** Dynamo Electric Machine. General Principles, Field Windings, (Varieties) Series, Shunt, Compound, etc. Short Shunt, Long Shunt. **Chapter V.**—Instructions for Operating Generators: Running a Single Generator, To Shut Down a Machine Not Run in Multiple, Sparking, Polarity, Excitation Grounds, Generators in Multiple, Connections, Running Generators in Multiple, To Shut Down a Machine Running in Multiple. **Chapter VI.**—The Electric Motor: General Principles, Counter Electromotive Force and Mechanical Power, Efficiency. **Chapter VII.**—Measurements and Tests of Street Railway Motors—Faults, Measurement by Drop of Potential Method (Examples), Insulation Tests, Voltmeter Method, Description of Voltmeter and Ammeter, The Wheatstone Bridge, Instructions for Operating, Drop of Potential in Motor Circuits. **Chapter VIII.**—Instructions for Operating Car Apparatus: Brushes, Sparking at Brushes, Bearings, Buckling, Fuse, Block, Operating Car, Trolley, etc. **Chapter IX.**—The Electric Motor Car in Detail. Series, Parallel, Controller, Reverse Switch, Rheostat, Fuse Box, Lightning Arrester, Brushes. **Chapter X.**—Definitions of Terms. **Chapter XI.**—Diagrams of Car Wiring and Controllers, with Written Descriptions and Diagrams of Combinations: Westinghouse System (G. No. 14, No. 28 and 28 A). General Electric (K, with W. P. Machines, K 2; General Electric Series Parallel Controller with Magnetic Brake). Walker System (12, E). Steel Motor Co. System. **Chapter XII.**—General Electrical and Mechanical Information. Belting, Shafting, Pulleys and Gears, Melting Point, Specific Gravity and Relative Conductivity. Table Comparing Wire Gauges, Number, Dimensions, Height, Length and Resistance of Pure Copper Wire, Electrical Units and Formulas, Equivalent Carrying Capacity, Proportions of Gear Teeth, Notes, Bill of Material for Span Wire Construction (Single Track). (Double Track), Bracket Construction, (Single Track) (Center Pole) (Double Track).

SLOW SPEED

Telephone Generator.

A direct-connected motor-dynamo to furnish current for operating telephone subscribers' bells. Capacity 1,200 phones, and guaranteed to ring six phones continuously. Furnished wound to be run on 110, 220 or 500 volt direct current circuits. Occupies space less than twelve inches square. Send for circular giving full particulars.

W. F. WARNER, - - Muncie Indiana.

A TECHNICAL EDUCATION 50 CENTS A WEEK.

The new installment plan of The International Correspondence Schools, Scranton, Pa.—the largest and most successful institution teaching technical subjects by mail—places an education within the reach of all. Students may enroll upon paying $2 in advance, the balance to be paid at the rate of $2 a month. The charges are moderate and include all necessary text-books. Studies are carried on at home without loss of time from work.

The Electrical Power and Lighting Scholarship is a thorough course of instruction in the installation, care and operation of electric light, power and railway plants designed to meet the wants of busy men who wish to put into actual practice as soon as possible the information they acquire.

The Mechanical-Electrical Scholarship includes instruction in mechanical and electrical engineering and is intended especially for those who wish to become designers of electrical machinery.

Also 13 courses including Steam Engineering, Mechanical Drawing, Machine Design, Civil Engineering, Bookkeeping, Shorthand and English branches.

Write for circular, stating subject in which you are interested.

Makes No Noise, Makes Money.

CATALOGUE TO ANY ADDRESS.

The race is not always to the swift.

The Warren Alternator runs at slow speed, in fact the part (armature) that in other dynamos must be spun at a terrific rate is stationary in the Warren And there isn't an inch of moving wire, no danger of bursting bands, no use for expensive, care-needing commutator, no sputtering brushes.

The bearings are self-oiling and are adjustable in every direction while machine is in motion.

Little attention and no expense for operation.

Westinghouse Machine Company,

MANUFACTURERS.

Westinghouse, Church, Kerr & Co.,

ENGINEERS.

Managers of Electric Light and Power Stations are getting more and more alert to the smaller economies in the generation of power. They are alive to the fact that their finished product is power, and therefore they install expensive boilers, efficient engines and generators, and often pay considerable attention to their steam piping: but how many who are doing all this are practically nullifying it all by improper firing? Do they not know that every time the fire door is opened it cools off the fire, wastes coal and injures their boilers?

The Roney Mechanical Stoker obviates all this, enables one to use a cheaper grade of fuel and at the same time to derive the best results from the excellent machinery which receives its power from this service.

If you would know more of this standard piece of apparatus, address:

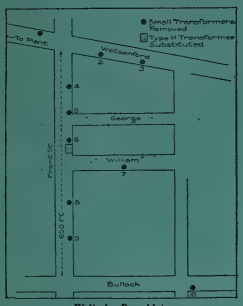
Transformer Economy No. 3.



Write for Pamphlet
"USE AND ABUSE OF TRANSFORMERS."

THE CHANGE AT CONSHOHOCKEN, PA.

Continuing the history of the change, diagram No. 3 shows another district at Conshohocken, Pa. Here 10 small Transformers of old type have been replaced by one TYPE H TRANSFORMER.

THE RESULT OF THE CHANGE:

Core loss of 10 small Transformers,	701
Core loss of the Type H Transformer substituted,	109
Saving in Watts,	**592**

If such results can be obtained in a single instance, will it not pay you to look more closely into this question of Transformer economy?

An Absolutely New Work. Complete and Unabridged.

The Pocket Electrical Dictionary.

FOURTH EDITION.

BY EDWIN J. HOUSTON, A. M., PH. D. (PRINCETON).

A most valuable contribution to electrical literature.
This new dictionary is destined to enjoy a world-wide sale. It contains over 11,000 words and about 15,000 definitions used in the science. There are several thousand new words now used in the science that have never appeared in any other single book.
It is indispensable to all electricians.
It is beautifully printed on fine paper, and is so compact that it can be carried in the pocket.
The type is large and clear. 950 pages.

1 Vol., 32mo, Cloth, $2.50; Leather, $3.00. Sent postpaid on receipt of price.

WE OFFER TO THE PUBLIC A NEW AND MARVELLOUS ELECTRIC CABLE,

As Reliable as a Galvanometer, as Infallible in Action, and Continuously Thermostatic.

Standardized in Sizes for all Interior Electric Adaptations. It is the only cable in the world combining Fire and Burglar Alarm protection with all other interior electric wiring work, in same installation. We confine ourselves to the manufacture and sale of this cable exclusively, it being auxiliary to all other electric interests.

By the use of this cable every infinitesimal part of every wire hereafter installed for whatever purpose in all buildings is made a detective point for the discovery and automatic notification of fire. We have opened up a new and rich field for the electrical contractor. If you are not acquainted with us and the cable, you should be. Write or call and become so.

Write for illustrated and descriptive printed matter.

We own the sole and exclusive right to manufacture and sell the Montauk Multiphase Cable and Central Station Controller, by virtue of the following patents: No. 546,261, Sept. 10, 1895; No. 546,262, Sept. 10, 1895; No. 565,053, Aug. 4, 1896; No. 565,178, Aug. 4, 1896; No. 565,188, Aug. 4, 1896; No. 565,217, Aug. 4, 1896; No. 565,410, Aug. 4, 1896; No. 594,034, Nov. 23, 1897; No. 594,247, Nov. 23, 1897; No. 594,281, Nov. 23, 1897, which broadly cover not only the method of manufacturing, but the basic principle upon which these cables are constructed.

REWARD.

The Electrical Trade is Cautioned

That inferior arc light carbons are offered by unscrupulous dealers on the representation that they are the genuine "ELECTRA" Carbons or just as good as the "ELECTRA" Carbons.

All genuine "ELECTRA" Carbons are packed in packages bearing a label with the Trade Mark

And the word "ELECTRA" being duly registered by me,

Can Only be Used in Connection with Carbons which are Handled by Me.

Any information in regard to persons offering carbons as genuine "ELECTRA" Carbons or advertising and offering their Carbons in connection with the word "ELECTRA" that will lead to the conviction of infringing parties, will be duly rewarded.

HUGO REISINGER,

Sole Importer of the "ELECTRA" Highest Grade Nuernberg Carbons.

New York, March, 1898. No. 11 Broadway.
